В

XVI. ARISTARCHUS OF SAMOS

(a) GENERAL

Aët. i. 15. 5; Doxographi Graeci, ed. Diels 313. 16-18

'Αρίσταρχος Σάμιος μαθηματικός ἀκουστής Στράτωνος φῶς εἶναι τὸ χρῶμα τοῖς ὑποκειμένοις ἐπιπῖπτον.

Archim. Aren. 1, Archim. ed. Heiberg ii. 218. 7-18

'Αρίσταρχος δὲ δ Σάμιος ὅποθεσίων τινῶν ἐξεέδωκεν γραφάς, ἐν αἶς ἐκ τῶν ὑποκειμένων συμβαίνει τὸν κόσμον πολλαπλάσιον εἶμεν τοῦ νῦν εἰρημένου. ὑποτίθεται γὰρ τὰ μὲν ἀπλανέα τῶν ἄστρων καὶ τὸν ἄλιον μένειν ἀκίνητον, τὰν δὲ γᾶν περιφέρεσθαι περὶ τὸν ἄλιον κατὰ κύκλου περιφέρειαν, ὅς ἐστιν ἐν μέσω τῷ δρόμω κείμενος, τὰν δὲ τῶν ἀπλανέων ἄστρων σφαῖραν περὶ τὸ

^a Strato of Lampsacus was head of the Lyceum from 288/287 to 270/269 g.c. The next extract shows that Aristarchus formulated his heliocentric hypothesis before Archimedes wrote the Sand-Reckoner, which can be shown to have been written before 216 g.c. From Ptolemy, Syntaxis iii. 2, Aristarchus is known to have made an observation of the summer solstice in 281/280 g.c. He is ranked by Vitruvius, De Architectura i. 1. 17 among those rare men, such as Philolaus, Archytas, Apollonius, Eratosthenes,

XVI. ARISTARCHUS OF SAMOS

(a) GENERAL

Aëtius i. 15. 5; Doxographi Graeci, ed. Diels 313. 16-18

Aristarchus of Samos, a mathematician and pupil of Strato,^a held that colour was light impinging on a substratum.

Archimedes, Sand-Reckoner 1, Archim. ed. Heiberg ii. 218. 7-18

Aristarchus of Samos produced a book based on certain hypotheses, in which it follows from the premises that the universe is many times greater than the universe now so called. His hypotheses are that the fixed stars and the sun remain motionless, that the earth revolves in the circumference of a circle about the sun, which lies in the middle of the orbit, and that the sphere of the fixed stars, situated

Archimedes and Scopinas of Syracuse, who were equally proficient in all branches of science. Vitruvius, loc. cit. ix. 8. 1, is also our authority for believing that he invented a sun-dial with a hemispherical bowl. His greatest achievement, of course, was the hypothesis that the earth moves round the sun, but as that belongs to astronomy it can be mentioned only casually here. A full and admirable discussion will be found in Heath, Aristarchus of Samos: The Ancient Copernicus, together with a critical text of Aristarchus's only extant work.

αὐτὸ κέντρον τῷ ἀλίῳ κειμέναν τῷ μεγέθει ταλικαύταν εἶμεν, ώστε τὸν κύκλον, καθ' ὅν τὰν γὰν ὑποτίθεται περιφέρεσθαι, τοιαύταν ἔχειν ἀναλογίαν ποτὶ τὰν τῶν ἀπλανέων ἀποστασίαν, οἵαν ἔχει τὸ κέντρον τᾶς σφαίρας ποτὶ τὰν ἐπιφάνειαν.

Plut. De facie in orbe lunae 6, 922 F-923 A

Καὶ ὁ Λεύκιος γελάσας, "Μόνον," εἶπεν, " ὧ τάν, μὴ κρίσιν ἡμῖν ἀσεβείας ἐπαγγείλης, ὥσπερ 'Αρίσταρχον ὤετο δεῖν Κλεάνθης τὸν Σάμιον ἀσεβείας προσκαλεῖσθαι τοὺς 'Ελληνας, ὡς κινοῦντα τοῦ κόσμου τὴν ἐστίαν, ὅτι τὰ φαινόμενα σώζειν ἀνὴρ ἐπειρᾶτο, μένειν τὸν οὐρανὸν ὑποτιθέμενος, ἐξελίττεσθαι δὲ κατὰ λοξοῦ κύκλου τὴν γῆν, ἅμα καὶ περὶ τὸν αὐτῆς ἄξονα ὸινουμένην."

(b) Distances of the Sun and Moon

Aristarch. Sam. De Mag. et Dist. Solis et Lunae, ed. Heath (Aristarchus of Samos: The Ancient Copernicus) 352, 1-354, 6

(Υποθέσεις1)

- α'. Τὴν σελήνην παρὰ τοῦ ἡλίου τὸ φῶς λαμβάνειν.
- β΄. Τὴν γῆν σημείου τε καὶ κέντρου λόγον ἔχειν πρὸς τὴν τῆς σελήνης σφαῖραν.

γ΄. "Όταν ή σελήνη διχότομος ήμιν φαίνηται,

¹ ὑποθέσεις add. Heath.

^a Aristarchus's last hypothesis, if taken literally, would mean that the sphere of the fixed stars is infinite. All that he implies, however, is that in relation to the distance of the

ARISTARCHUS OF SAMOS

about the same centre as the sun, is so great that the circle in which he supposes the earth to revolve has such a proportion to the distance of the fixed stars as the centre of the sphere bears to its surface.^a

Plutarch, On the Face in the Moon 6, 922 F-923 A

Lucius thereupon laughed and said: "Do not, my good fellow, bring an action against me for impiety after the manner of Cleanthes, who held that the Greeks ought to indict Aristarchus of Samos on a charge of impiety because he set in motion the hearth of the universe; for he tried to save the phenomena by supposing the heaven to remain at rest, and the earth to revolve in an inclined circle, while rotating at the same time about its own axis."

(b) Distances of the Sun and Moon

Aristarchus of Samos, On the Sizes and Distances of the Sun and Moon, ed. Heath (Aristarchus of Samos). The Ancient Copernicus) 352, 1-354, 6

HYPOTHESES

1. The moon receives its light from the sun.

2. The earth has the relation of a point and centre to the sphere in which the moon moves.^c

3. When the moon appears to us halved, the great

fixed stars the diameter of the earth's orbit may be neglected. The phrase appears to be traditional (v. Aristarchus's second

hypothesis, infra).

b Heraclides of Pontus (along with Ecphantus, a Pythagorean) had preceded Aristarchus in making the earth revolve on its own axis, but he did not give the earth a motion of translation as well.

Lit. " sphere of the moon."

νεύειν εἰς τὴν ἡμετέραν ὄψιν τὸν διορίζοντα τό τε σκιερὸν καὶ τὸ λαμπρὸν τῆς σελήνης μέγιστον κύκλον.

δ΄. "Όταν ή σελήνη διχότομος ήμιν φαίνηται, τότε αὐτὴν ἀπέχειν τοῦ ἡλίου ἔλασσον τεταρτημορίου τῷ τοῦ τεταρτημορίου τριακοστῷ.

Τὸ τῆς σκιᾶς πλάτος σεληνῶν εἶναι δύο.

ς'. Τὴν σελήνην ὑποτείνειν ὑπὸ πεντεκαιδέκατον

μέρος ζωδίου.

Έπιλογίζεται οὖν τὸ τοῦ ἡλίου ἀπόστημα ἀπὸ τῆς γῆς τοῦ τῆς σελήνης ἀποστήματος μεῖζον μὲν ἢ ὀκτωκαιδεκαπλάσιον, ἔλασσον δὲ ἢ εἰκοσαπλάσιον, διὰ τῆς περὶ τὴν διχοτομίαν ὑποθέσεως τὸν αὐτὸν δὲ λόγον ἔχειν τὴν τοῦ ἡλίου διάμετρον πρὸς τὴν τῆς σελήνης διάμετρον. τὴν δὲ τοῦ ἡλίου διάμετρον πρὸς τὴν τῆς γῆς διάμετρον μείζονα μὲν λόγον ἔχειν ἢ ὅν τὰ ιθ πρὸς γ̄, ἐλάσσονα δὲ ἢ ὅν μ̄γ πρὸς ε̄, διὰ τοῦ εὐρεθέντος περὶ τὰ ἀποστήματα λόγου, τῆς ⟨τε¹⟩ περὶ τὴν σκιὰν ὑποθέσεως, καὶ τοῦ τὴν σελήνην ὑπὸ πεντεκαιδέκατον μέρος ζωδίου ὑποτείνειν.

Ibid., Prop. 7, ed. Heath 376. 1-380. 28

Τὸ ἀπόστημα ὁ ἀπέχει ὁ ἥλιος ἀπὸ τῆς γῆς τοῦ

τε add. Heath.

^a Lit. "verges towards our eye." For "verging," v. vol. i. p. 244 n. a. Aristarchus means that the observer's eye lies in the plane of the great circle in question. A great circle is a circle described on the surface of the sphere and having the same centre as the sphere; as the Greek implies, a great circle is the "greatest circle" that can be described on the sphere.

ARISTARCHUS OF SAMOS

circle dividing the dark and the bright portions of the moon is in the direction of our eye.^a

- 4. When the moon appears to us halved, its distance from the sun is less than a quadrant by one-thirtieth of a quadrant.^b
- 5. The breadth of the earth's shadow is that of two moons.^c
- 6. The moon subtends one-fifteenth part of a sign of the $zodiac.^d$

It may now be proved that the distance of the sun from the earth is greater than eighteen times, but less than twenty times, the distance of the moon—this follows from the hypothesis about the halved moon; that the diameter of the sun has the aforesaid ratio to the diameter of the moon; and that the diameter of the sun has to the diameter of the earth a ratio which is greater than 19:3 but less than 43:6—this follows from the ratio discovered about the distances, the hypothesis about the shadow, and the hypothesis that the moon subtends one-fifteenth part of a sign of the zodiac.

Ibid., Prop. 7, ed. Heath 376. 1-380. 28

The distance of the sun from the earth is greater than

 b i.e., is less than 90° by 3°, and so is 87°. The true value is 89° 50′.

c i.e., the breadth of the earth's shadow where the moon traverses it during an eclipse. The figure is presumably based on records of eclipses. Hipparchus made the figure 21 for the time when the moon is at its mean distance, and Ptolemy a little less than 23 for the time when the moon is at its greatest distance.

 d^{i} i.e., the angular diameter of the moon is one-fifteenth of 30°, or 2° . The true value is about $\frac{1}{2}$ °, and in the Sand-Reckoner (Archim. ed. Heiberg ii. 222. 6-8) Archimedes says that Aristarchus "discovered that the sun appeared to be about $\frac{1}{2}\frac{1}{2}$ 6th part of the circle of the Zodiac"; as he believed

ἀποστήματος οὖ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς μεῖζον μέν ἐστιν ἢ ὀκτωκαιδεκαπλάσιον, ἔλασσον δὲ ἢ εἰκοσαπλάσιον.

"Εστω γὰρ ἡλίου μὲν κέντρον τὸ Α, γῆς δὲ τὸ Β, καὶ ἐπιζευχθεῖσα ἡ ΑΒ ἐκβεβλήσθω, σελήνης δὲ κέντρον διχοτόμου οὔσης τὸ Γ, καὶ ἐκβεβλήσθω διὰ τῆς ΑΒ καὶ τοῦ Γ ἐπίπεδον, καὶ ποιείτω τομὴν ἐν τῆ σφαίρα, καθ' ἦς φέρεται τὸ κέντροι τοῦ ἡλίου, μέγιστον κύκλον τὸν ΑΔΕ, καὶ ἐπεζεύχθωσαν αἱ ΑΓ, ΓΒ, καὶ ἐκβεβλήσθω ἡ ΒΓ ἐπὶ τὸ Δ.

"Εσται δή, διὰ τὸ τὸ Γ σημεῖον κέντρον εἶναι τῆς σελήνης διχοτόμου οἴσης, ὀρθὴ ἡ ὑπὸ τῶν

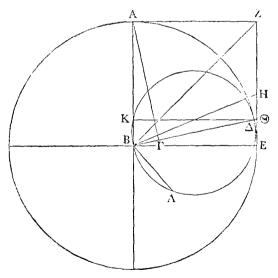

that the sun and moon had the same annular diameter he must, therefore, have found the approximately correct angular diameter of $\frac{1}{2}$ after writing his treatise On the Sizes and Distances of the Sun and Moon.

ARISTARCHUS OF SAMOS

eighteen times, but less than twenty times, the distance of the moon from the earth.

For let Λ be the centre of the sun, B that of the earth; let AB be joined and produced; let Γ be the centre of the moon when halved; let a plane be drawn through AB and Γ , and let the section made by it in the sphere on which the centre of the sun moves be the great circle $\Lambda\Delta E$, let $\Lambda\Gamma$, ΓB be joined, and let $B\Gamma$ be produced to Δ .

Then, because the point Γ is the centre of the moon when halved, the angle AFB will be right.

AΓΒ. $\mathring{\eta}\chi\theta\omega$ δὴ ἀπὸ τοῦ B τ $\mathring{\eta}$ BA πρὸς ορθὰς $\mathring{\eta}$ BE. ἔσται δὴ $\mathring{\eta}$ Ε Δ περιφέρεια τ $\mathring{\eta}$ ς Ε Δ A περιφερείας λ' υπόκειται γάρ, όταν ή σελήνη διχότομος ήμιν φαίνηται, ἀπέχειν ἀπὸ τοῦ ήλίου έλασσον τεταρτημορίου τῷ τοῦ τεταρτημορίου λ΄. ωστε καὶ ἡ ὑπὸ τῶν ΕΒΓ γωνία ὀρθῆς ἐστι λ΄. συμπεπληρώσθω δή το ΑΕ παραλληλόγραμμον, καὶ ἐπεζεύχθω ἡ ΒΖ. ἔσται δὴ ἡ ὑπὸ τῶν ΖΒΕ γωνία ἡμίσεια ὀρθῆς. τετμήσθω ἡ ὑπὸ τῶν ΖΒΕ γωνία δίχα τῆ ΒΗ εὐθεία ἡ ἄρα ὑπὸ τῶν ΗΒΕ γωνία τέταρτον μέρος ἐστίν ὀρθῆς. ἀλλὰ καὶ ή ύπὸ τῶν ΔΒΕ γωνία λ' ἐστι μέρος ὀρθῆς· λόγος άρα της ύπο των ΗΒΕ γωνίας προς την ύπο των ΔΒΕ γωνίαν ζέστιν¹) δν ζέχει²) τὰ τε πρὸς τὰ δύο· οίων γάρ έστιν ὀρθὴ γωνία ξ, τοιούτων ἐστιν ή μεν ύπο των ΗΒΕ τε, ή δε ύπο των ΔΒΕ δύο. καὶ ἐπεὶ ἡ ΗΕ πρὸς τὴν ΕΘ μείζονα λόγον ἔχει ήπερ ή ύπὸ τῶν ΗΒΕ γωνία πρὸς τὴν ὑπὸ τῶν ΔΒΕ γωνίαν, ή άρα ΗΕ πρὸς τὴν ΕΘ μείζονα λόγον ἔχει ἤπερ τὰ τε πρὸς τὰ Β΄. καὶ ἐπεὶ ἴση έστιν ή ΒΕ τῆ ΕΖ, καὶ ἔστιν ὀρθή ή πρὸς τῶ Ε. τὸ ἄρα ἀπὸ τῆς ΖΒ τοῦ ἀπὸ ΒΕ διπλάσιόν ἐστιν. ώς δὲ τὸ ἀπὸ ΖΒ πρὸς τὸ ἀπὸ ΒΕ, οὕτως ἐστὶ τὸ ἀπὸ ΖΗ πρὸς τὸ ἀπὸ ΗΕ· τὸ ἄρα ἀπὸ ΖΗ τοῦ ἀπὸ ΗΕ διπλάσιόν ἐστι. τὰ δὲ $\overline{\mu\theta}$ τῶν $\overline{\kappa\epsilon}$ έλάσσονά έστιν η διπλάσια, ώστε τὸ ἀπὸ ΖΗ πρὸς τὸ ἀπὸ ΗΕ μείζονα λόγον ἔχει ἢ ζον τὰ³⟩ μθ πρὸς κε καὶ ή ΖΗ άρα πρὸς τὴν ΗΕ μείζονα λόγον

 $^{^{1}}$ ἐστὶν add. Nizze. 2 ἔχει add. Wallis. 3 ὅν τὰ add. Wallis.

^a Lit. "circumference," as in several other places in this proposition.

ARISTARCHUS OF SAMOS

From B let BE be drawn at right angles to BA. Then the arc a EA will be one-thirtieth of the arc $E\Delta A$: for, by hypothesis, when the moon appears to us halved, its distance from the sun is less than a quadrant by one-thirtieth of a quadrant [Hypothesis 4]. Therefore the angle ΕΒΓ is also one-thirtieth of a right angle. Let the parallelogram AE be completed, and let BZ be joined. Then the angle ZBE will be one-half of a right angle. Let the angle ZBE be bisected by the straight line BH; then the angle HBE is one-fourth part of a right angle. But the angle ΔBE is one-thirtieth part of a right angle; therefore angle HBE; angle $\Delta BE = 15:2$; for, of those parts of which a right angle contains 60, the angle HBE contains 15 and the angle ΔBE contains 2.

Now since

 $HE: E\Theta > angle \ HBE: angle \ \Delta BE,$

therefore $HE: E\theta > 15:2$.

And since BE = EZ, and the angle at E is right, therefore

 $ZB^2 = 2BE^2$.

But $ZB^2:BE^2=ZH^2:HE^2$.

Therefore $ZH^2 = 2IIE^2$.

Now 49 < 2.25,

so that $ZH^2: HE^2 > 49:25.$

Therefore ZH:HE > 7:5.

b Aristarchus's assumption is equivalent to the theorem

$$\frac{\tan \alpha}{\tan \beta} > \frac{\alpha}{\beta},$$

where $\beta < \alpha \le \frac{1}{2}\pi$. Euclid's proof in *Optics* 8 is given in vol. i. pp. 502-505.

έχει ἢ ⟨ον¹⟩ τὰ ζ πρὸς τὰ ε΄ καὶ συνθέντι ἡ ΖΕ άρα πρὸς τὴν ΕΗ μείζονα λόγον ἔχει ἢ ὃν τὰ ιβ π ρὸς τὰ $ar{\epsilon}$, τουτέστιν, ἢ ὃν $\left\langle au \grave{a}^2

¹ δν add. Wallis.

^{2 7}à add, Wallis.

ARISTARCHUS OF SAMOS

Therefore, componendo, ZE : EH > 12 : 5, that is, ZE : EH > 36 : 15.

at 1s, ZE: Eff > 50: 15

But it was also proved that

 $HE : E\theta > 15 : 2.$

Therefore, ex aequali,^a ZE: $E \leftrightarrow > 36: 2$, that is. ZE: $E \leftrightarrow > 18: 1$.

Therefore ZE is greater than eighteen times $E\theta$. And ZE is equal to BE. Therefore BE is also greater than eighteen times $E\theta$. Therefore BH is much greater than eighteen times ΘE .

But $B\Theta : OE = AB : B\Gamma$,

by similarity of triangles. Therefore AB is also greater than eighteen times $B\Gamma$. And AB is the distance of the sun from the earth, while ΓB is the distance of the moon from the earth; therefore the distance of the sun from the earth is greater than eighteen times the distance of the moon from the earth.

I say now that it is less than twenty times. For through Δ let ΔK be drawn parallel to ΔB , and about the triangle ΔKB let the circle ΔKB be drawn; its diameter will be ΔB , by reason of the angle at K being right. Let $B\Lambda$, the side of a hexagon, be fitted into the circle. Then, since the angle ΔBE is one-thirtieth of a right angle, therefore the angle $B\Delta K$ is also one-thirtieth of a right angle. Therefore the arc BK is one-sixtieth of the whole circle. But $B\Lambda$ is one-sixth part of the whole circle.

Therefore are BA = 10 are BK.

And the arc BA has to the arc BK a ratio greater

^a For the proportion ex aequali, v. vol. i. pp. 448-451.

εὐθεῖα πρὸς τὴν BK εὐθεῖαν· ἡ ἄρα BΛ εὐθεῖα τῆς BK εὐθείας ἐλάσσων ἐστὶν ἢ ῖ. καὶ ἔστιν αὐτῆς διπλῆ ἡ $B\Delta$ · ἡ ἄρα $B\Delta$ τῆς BK ἐλάσσων ἐστὶν ἢ κ̄. ώς δὲ ἡ $B\Delta$ πρὸς τὴν BK, ἡ AB πρὸς ⟨τὴν¹⟩ $B\Gamma$, ὥστε καὶ ἡ AB τῆς $B\Gamma$ ἐλάσσων ἐστὶν ἢ κ̄. καὶ ἔστιν ἡ μὲν AB τὸ ἀπόστημα δ ἀπέχει ὁ ἥλιος ἀπὸ τῆς γῆς, ἡ δὲ $B\Gamma$ τὸ ἀπόστημα δ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς τὸ ἄρα ἀπόστημα δ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς τοῦ ἀποστήματος, οῦ ἀπέχει ἡ σελήνη ἀπὸ τῆς γῆς, ἔλασσόν ἐστιν ἢ κ̄. ἐδείχθη δὲ καὶ μεῖζον ἢ $\overline{\iota\eta}$.

Ibid., Prop. 13, ed. Heath 396. 1-2

"Εχει δὲ καὶ τὰ ζλκα πρὸς ,δν μείζονα λόγον ηπερ τὰ πη πρὸς με.

Ibid., Prop. 15, ed. Heath 406. 23-24

Έχει δὲ καὶ ὁ $\stackrel{\zeta_{\rho o e}}{M}$,εωοε πρὸς $\stackrel{\zeta_{\rho o \gamma}}{M}$,εφ μείζονα λόγον ἢ ὃν τὰ $\overline{\mu \gamma}$ πρὸς $\overline{\lambda \zeta}$.

1 την add. Wallis.

^a This is proved in Ptolemy's Syntaxis i. 10, v. infra, pp. 435-439.

^b If $\frac{7921}{4050}$ is developed as a continued fraction, we obtain the approximation $1 + \frac{1}{1 +} \frac{1}{21 +} \frac{1}{2}$, which is $\frac{88}{45}$. Similarly, if $\frac{71755875}{61735500}$ or $\frac{21261}{18292}$ is developed as a continued fraction, we

ARISTARCHUS OF SAMOS

than that which the straight line BA has to the straight line BK.

 $\begin{array}{lll} \textbf{Therefore} & B\Lambda < 10 \; . \; BK. \\ \textbf{And} & B\Delta = 2 \; B\Lambda. \\ \textbf{Therefore} & B\Delta < 20 \; . \; BK. \\ \textbf{But} & B\Delta : BK = AB \; . \; BI. \\ \textbf{Therefore} & AB < 20 \; . \; B\Gamma. \end{array}$

And AB is the distance of the sun from the earth, while B Γ is the distance of the moon from the earth; therefore the distance of the sun from the earth is less than twenty times the distance of the moon from the earth. And it was proved to be greater than eighteen times.

(c) Continued Fractions (?)

Ibid., Prop. 13, ed. Heath 396. 1-2

But 7921 has to 4050 a ratio greater than that which 88 has to 45.

Ibid., Prop. 15, ed. Heath 406. 23-24

But 71755875 has to 61735500 a ratio greater than that which 43 has to 37.

obtain the approximation $1+\frac{1}{6+}$ $\frac{1}{6}$ or $\frac{43}{37}$. The latter result was first noticed in 1823 by the Comte de Fortia D'Urban (*Traité d'Aristarque de Samos*, p. 186 n. 1), who added: "Ainsi les Grees, malgré l'imperfection de leur numération, avaient des méthodes semblables aux nôtres." Though these relations are hardly sufficient to enable us to say that the Greeks knew how to develop continued fraction, they lend some support to the theory developed by D'Arcy W. Thompson in Mind, xxxviii. pp. 43-55, 1929.

^a A life of Archimedes was written by a certain Heraclides—perhaps the Heraclides who is mentioned by Archimedes himself in the preface to his book On Spirals (Archim. ed. Heiberg ii. 2.3) as having taken his books to Dosstheus. We know this from two references by Eutocius (Archim. ed. Heiberg iii. 228. 20, Apollon. ed. Heiberg ii. 168. 3, where, however, the name is given as 'Hράκλειοs'), but it has not survived. The surviving writings of Archimedes, together with the commentaries of Eutocius of Ascalon (fl. A.D. 520), have been edited by J. L. Heiberg in three volumes of the Teubner series (references in this volume are to the 2nd ed., Leipzig, 1910–1915). They have been put into mathematical notation by T. L. Heath, The Works of Archimedes (Cam-

XVII. ARCHIMEDES a

(a) GENERAL

Tzetzes, Book of Histories ii. 103-144 b

ARCHIMEDES the wise, the famous maker of engines, was a Syracusan by race, and worked at geometry till old age, surviving five-and-seventy-years ^c; he reduced to his service many mechanical powers, and with his triple-pulley device, using only his left hand, he drew a vessel of fifty thousand medimni burden. Once, when Marcellus, the Roman general, was assaulting Syracuse by land and sea, first by his engines he drew up some merchant-vessels, lifted them up against the wall of Syracuse, and sent them in a heap again to the bottom, crews and all. When Marcellus had withdrawn his ships a little distance, the old man gave all the Syracusans power to lift

bridge, 1897), supplemented by The Method of Archimedes (Cambridge, 1922), and have been translated into French by Paul Ver Eecke, Les Œuvres complètes d'Archimède

(Brussels, 1921).

b The lines which follow are an example of the "political" (πολιτικόs, popular) verse which prevailed in Byzantine times. The name is given to verse composed by accent instead of quantity, with an accent on the last syllable but one, especially an iambic verse of fifteen syllables. The twelfth-century Byzantine pedant, John Tzetzes, preserved in his Book of Histories a great treasure of literary, historical, theological and scientific detail, but it needs to be used with caution. The work is often called the Chiliades from its arbitrary division by its first editor (N. Gerbel, 1546) into books of 1000 lines each—it actually contains 12,674 lines.

^c As he perished in the sack of Syracuse in 212 B.c., he

was therefore born about 287 B.C.

Μετεωρίζειν δύνασθαι λίθους άμαξιαίους Καὶ τὸν καθένα πέμποντας βυθίζειν τὰς δλκάδας. 'Ως Μάρκελλος δ' ἀπέστησε βολὴν ἐκείνας τόξου, 'Εξάγωνόν τι κάτοπτρον ἐτέκτηνεν ὁ γέρων, 'Απὸ δὲ διαστήματος συμμέτρου τοῦ κατόπτρου Μικρὰ τοιαῦτα κάτοπτρα θεὶς τετραπλᾶ γωνίαις Κινούμενα λεπίσι τε καί τισι γιγγλυμίοις, Μέσον ἐκεῖνο τέθεικεν ἀκτίνων τῶν ἡλίου Μεσημβρινῆς καὶ θερινῆς καὶ χειμεριωτάτης. 'Ανακλωμένων δὲ λοιπὸν εἰς τοῦτο τῶν ἀκτίνων 'Έξαψις ἤρθη φοβερὰ πυρώδης ταῖς ὁλκάσι, Καὶ ταύτας ἀπετέφρωσεν ἐκ μήκους τοξοβόλου. Οὕτω νικᾶ τὸν Μάρκελλον ταῖς μηχαναῖς ὁ γέρων. 'Έλεγε δὲ καὶ δωριστί, φωνῆ Συρακουσία. '' Πᾶ βῶ, καὶ χαριστίωνι τὰν γᾶν κινήσω πᾶσαν.''

1 πέμποντας Cary, πέμποντα codd.

The loss of the original Doric is not the only defect in the

^a Unfortunately, the earliest authority for this story is Lucian, Hipp. 2: τ ον δὲ (sc. ᾿Αρχιμήδην) τὰς τῶν πολεμίων τριήρεις καταφλέξαντα τῆ τέχνη. It is also found in Galen, Ileρὶ κρασ. iii. 2, and Zonaras xiv. 3 relates it on the authority of Dion Cassius, but makes Proclus the hero of it.

b Further evidence is given by Tzetzes, Chil. xii. 995 and Eutocius (Archim. ed. Heiberg iii. 132. 5-6) that Archimedes wrote in the Doric dialect, but the extant text of his best-known works, On the Sphere and Cylinder and the Measurement of a Circle, retains only one genuine trace of its original Doric—the form τῆνον. Partial losses have occurred in other books, the Sand-Reckoner having suffered least. The subject is fully treated by Heiberg, Quaestiones Archimedeae, pp. 69-94, and in a preface to the second volume of his edition of Archimedes he indicates the words which he has restored to their Doric form despite the manuscripts; his text is adopted in this selection.

ARCHIMEDES

stones large enough to load a waggon and, hurling them one after the other, to sink the ships. When Marcellus withdrew them a bow-shot, the old man constructed a kind of hexagonal mirror, and at an interval proportionate to the size of the mirror he set similar small mirrors with four edges, moved by links and by a form of hinge, and made it the centre of the sun's beams-its noon-tide beam, whether in summer or in mid-winter. Afterwards, when the beams were reflected in the mirror, a fearful kindling of fire was raised in the ships, and at the distance of a bow-shot he turned them into ashes.^a In this way did the old man prevail over Marcellus with his weapons. In his Doric b dialect, and in its Syracusan variant, he declared: "If I have somewhere to stand, I will move the whole earth with my charistion." c

text. The hand of an interpolator—often not particularly skilful—can be repeatedly detected, and there are many loose expressions which Archimedes would not have used, and occasional omissions of an essential step in his argument. Sometimes the original text can be inferred from the commentaries written by Eutocius, but these extend only to the books On the Sphere and Cylinder, the Measurement of a Circle, and On Plane Equilibriums. A partial loss of Doric forms had already occurred by the time of Eutocius, and it is believed that the works most widely read were completely recast a little later in the school of Isidorus of Miletus to make them more easily intelligible to pupils.

τ The instrument is otherwise mentioned by Simplicius (in Aristot. Phys., ed. Diels 1110. 2-5) and it is implied that it was used for weighing: τ αύτη δὲ τῆ ἀναλογία τοῦ κινοῦντος καὶ τοῦ κινουμένου καὶ τοῦ διαστήματος τὸ σταθμιστικὸν ὄργανον τὸν καλούμενον χαριστίωνα συστήσας ὁ ᾿Αρχιμήδης ὡς μέχρι παιτὸς τῆς ἀναλογίας προχωρούσης ἐκόμπασεν ἐκεῖνο τὸ ¨ πᾶ βῶ καὶ κινῶ τὰν γᾶν. ' Ας Tzetzes in another place (Chil. iii. 61: ὁ γῆν ἀνασπῶν μηχανῆ τῆ τρισπάστω βοῶν ¨ ὅπα βῶ καὶ σαλεύσω τὴν χθόνα ¨) writes of a triple-pulley device in the same connexion, it may be presumed to have been of this nature.

Οὖτος, κατὰ Διόδωρον, τῆς Συρακούσης ταύτης Προδότου πρὸς τὸν Μάρκελλον ἀθρόως γενομένης, Εἴτε, κατὰ τὸν Δίωνα, 'Ρωμαίοις πορθηθείσης, 'Αρτέμιδι τῶν πολιτῶν τότε παννυχιζόντων, Τοιουτοτρόπως τέθνηκεν ὑπό τινος 'Ρωμαίου. 'Ην κεκυφώς, διάγραμμα μηχανικόν τι γράφων, Τὶς δὲ 'Ρωμαίος ἐπιστὰς εἶλκεν αἰχμαλωτίζων. 'Ο δὲ τοῦ διαγράμματος ὅλος ὑπάρχων τότε, Τίς ὁ καθέλκων οὐκ εἶδώς, ἔλεγε πρὸς ἐκεῖνον· '' 'Απόστηθι, ὧ ἄνθρωπε, τοῦ διαγράμματός μου.'' 'Ως δ' εἶλκε τοῦτον συστραφεὶς καὶ γνοὺς 'Ρωμαῖον εἶναι,

Plut. Marcellus xiv. 7-xvii. 7

Καὶ μέντοι καὶ ᾿Αρχιμήδης, Ἱέρωνι τῷ βασιλεῖ συγγενης ὢν καὶ φίλος, ἔγραψεν ὡς τῆ δοθείση δυνάμει τὸ δοθὲν βάρος κινησαι δυνατόν ἐστι· καὶ νεανιευσάμενος, ὡς φασι, ρώμη τῆς ἀποδείξεως εἶπεν ὡς, εἰ γῆν εἶχεν ἐτέραν, ἐκίνησεν ὢν ταύτην μεταβὰς εἰς ἐκείνην. θαυμάσαντος δὲ τοῦ Ἱέρωνος, καὶ δεηθέντος εἰς ἔργον ἐξαγαγεῖν τὸ πρόβλημα καὶ δεῖξαί τι τῶν μεγάλων κινούμενον ὑπὸ σμικρᾶς δυνάμεως, ὁλκάδα τριάρμενον τῶν βασιλικῶν πόνω μεγάλω καὶ χειρὶ πολλῆ νεωλκηθεῖσαν, ἐμβαλὼν ὰιθρώπους τε πολλοὺς καὶ τὸν συνήθη φόρτον, αὐτὸς ἄπωθεν καθήμενος, οὐ μετὰ σπουδῆς, ἀλλὰ

a Diod. Sic. Frag. Book xxvi.

^{*} The account of Dion Cassius has not survived.

c Zonaras ix. 5 adds that when he heard the enemy were

ARCHIMEDES

Whether, as Diodorus a asserts, Syracuse was betrayed and the citizens went in a body to Marcellus, or, as Dion b tells, it was plundered by the Romans, while the citizens were keeping a night festival to Artemis, he died in this fashion at the hands of one of the He was stooping down, drawing some diagram in mechanics, when a Roman came up and began to drag him away to take him prisoner. he, being wholly intent at the time on the diagram, and not perceiving who was tugging at him, said to the man: "Stand away, fellow, from my diagram." c As the man continued pulling, he turned round and, realizing that he was a Roman, he cried, "Somebody give me one of my engines." But the Roman, scared, straightway slew him, a feeble old man but wonderful in his works.

Plutarch, Marcellus xiv. 7-xvii. 7

Archimedes, who was a kinsman and friend of King Hiero, wrote to him that with a given force it was possible to move any given weight; and emboldened, as it is said, by the strength of the proof, he averred that, if there were another world and he could go to it, he would move this one. Hiero was amazed and besought him to give a practical demonstration of the problem and show some great object moved by a small force; he thereupon chose a three-masted merchantman among the king's ships which had been hauled ashore with great labour by a large band of men, and after putting on board many men and the usual cargo, sitting some distance away and without any special effort, he pulled gently with his hand at

coming " $\pi \grave{a} \rho$ $\kappa \epsilon \phi a \lambda \acute{a} \nu$ " $\check{\epsilon} \phi \eta$ " $\kappa a \iota \mu \grave{\eta} \pi \cdot \rho \grave{a}$ $\gamma \rho a \mu \mu \acute{a} \nu$ "—" Let them come at my head," he said, "but not at my line."

ήρέμα τῆ χειρὶ σείων ἀρχήν τινα πολυσπάστου προσηγάγετο λείως καὶ ἀπταίστως καὶ ὥσπερ διὰ θαλάττης ἐπιθέουσαν. ἐκπλαγεὶς οὖν ὁ βασιλεὺς καὶ συννοήσας τῆς τέχνης τὴν δύναμιν, ἔπεισε τὸν ᾿Αρχιμήδην ὅπως αὐτῷ τὰ μὲν ἀμυνομένῳ, τὰ δ᾽ ἐπιχειροῦντι μηχανήματα κατασκευάση πρὸς πᾶσαν ἰδέαν πολιορκίας, οἷς αὐτὸς μὲν οὐκ ἐχρήσατο, τοῦ βίου τὸ πλεῖστον ἀπόλεμον καὶ πανηγυρικὸν βιώσας, τότε δ᾽ ὑπῆρχε τοῖς Συρακουσίοις εἰς δέον ἡ παρασκευὴ καὶ μετὰ τῆς

παρασκευής ό δημιουργός.

'Ως οὖν προσέβαλον οἱ 'Ρωμαῖοι διχόθεν, ἔκπληξις ἦν τῶν Συρακουσίων καὶ σιγὴ διὰ δέος, μηδὲν ἂν ἀνθέξειν πρὸς βίαν καὶ δύναμιν οἰομένων τοσαύτην. σχάσαντος δὲ τὰς μηχανὰς τοῦ ᾿Αρχιμήδους ἄμα τοῖς μὲν πεζοῖς ἀπήντα τοξεύματά τε παντοδαπὰ καὶ λίθων ὑπέρογκα μεγέθη, ροίζω καὶ τάχει καταφερομένων ἀπίστω, καὶ μηδενὸς ὅλως τὸ βρῖθος στέγοντος ἀθρόους ἀνατρεπόντων τοὺς ὑποπίπτοντας καὶ τὰς τάξεις συγχεόντων, ταῖς δὲ ναυσὶν ἀπὸ τῶν τειχῶν ἄφνω ὑπεραιωρούμεναι κεραῖαι τὰς μὲν ὑπὸ βρίθους στηρίζοντος ἄνωθεν ἀθοῦσαι κατέδυον εἰς βυθόν, τὰς δὲ χεραὶ σιδηραῖς ἢ στόμασιν εἰκασμένοις γεράνων ἀνασπῶσαι πρώραθεν ὀρθὰς ἐπὶ πρύμναν ἐβάπτιζον,

^a πολυσπάστος. Galen, in Hipp. De Artic. iv. 47 uses the same word. Tzetzes (loc. cit.) speaks of a triple-pulley device ($\tau \hat{\eta}$ τρισπάστω μηχαν $\hat{\eta}$) in the same connexion, and Oribasius, Coll. med. xlix. 22 mentions the τρίσπαστος as an invention of Archimedes; he says that it was so called because it had three ropes, but Vitruvius says it was thus named because it had three wheels. Athenaeus v. 207 a-b says that a helix was used. Heath, The Works of Archimedes,

the end of a compound pulley ^a and drew the vessel smoothly and evenly towards himself as though she were running along the surface of the water. Astonished at this, and understanding the power of his art, the king persuaded Archimedes to construct for him engines to be used in every type of siege warfare, some defensive and some offensive; he had not himself used these engines because he spent the greater part of his life remote from war and amid the rites of peace, but now his apparatus proved of great advantage to the Syracusans, and with the apparatus its inventor.^b

Accordingly, when the Romans attacked them from two elements, the Syracusans were struck dumb with fear, thinking that nothing would avail against such violence and power. But Archimedes began to work his engines and hurled against the land forces all sorts of missiles and huge masses of stones, which came down with incredible noise and speed; nothing at all could ward off their weight, but they knocked down in heaps those who stood in the way and threw the ranks into disorder. Furthermore, beams were suddenly thrown over the ships from the walls, and some of the ships were sent to the bottom by means of weights fixed to the beams and plunging down from above; others were drawn up by iron claws, or crane-like beaks, attached to the prow and were

p. xx, suggests that the vessel, once started, was kept in motion by the system of pulleys, but the first impulse was given by a machine similar to the κοχλίας described by Pappus viii. ed. Hultsch 1066, 1108 ff., in which a cog-wheel with oblique teeth moves on a cylindrical helix turned by a handle.

^b Similar stories of Archimedes' part in the defence are told by Polybius viii. 5. 3-5 and Livy xxiv. 34.

η δι' ἀντιτόνων ἔνδον ἐπιστρεφόμεναι καὶ περιαγόμεναι τοῖς ὑπὸ τὸ τεῖχος πεφυκόσι κρημνοῖς καὶ σκοπέλοις προσήρασσον, ἄμα φθόρω πολλώ τῶν έπιβατών συντριβομένων. πολλάκις δε μετέωρος έξαρθείσα ναῦς ἀπὸ τῆς θαλάσσης δεῦρο κἀκείσε περιδινουμένη καὶ κρεμαμένη θέαμα φρικώδες ήν, μέχρι οδ τῶν ἀνδρῶν ἀπορριφέντων καὶ διασφένδονηθέντων κενή προσπέσοι τοῖς τείχεσιν ή περιολίσθοι της λαβης ἀνείσης. ην δὲ ὁ Μάρκελλος άπὸ τοῦ ζεύγματος ἐπῆγε μηχανήν, σαμβύκη μὲν έκαλεῖτο δι' όμοιότητά τινα σχήματος πρός τὸ μουσικον ὄργανον, έτι δε ἄπωθεν αὐτῆς προσφερομένης πρὸς τὸ τεῖχος ἐξήλατο λίθος δεκατάλαντος όλκήν, είτα έτερος επί τούτω και τρίτος, ὧν οί μεν αὐτη εμπεσόντες μεγάλω κτύπω καὶ κλύδωνι της μηχανής την τε βάσιν συνηλόησαν καὶ τὸ γόμφωμα διέσεισαν καὶ διέσπασαν τοῦ ζεύγματος. ωστε τον Μάρκελλον απορούμενον αὐτόν τε ταῖς ναυσίν ἀποπλείν κατὰ τάχος καὶ τοῖς πεζοῖς ἀναγώρησιν παρεγγυήσαι.

plunged down on their sterns, or were twisted round and turned about by means of ropes within the city, and dashed against the cliffs set by Nature under the wall and against the rocks, with great destruction of the crews, who were crushed to pieces. Often there was the fearful sight of a ship lifted out of the sea into mid-air and whirled about as it hung there, until the men had been thrown out and shot in all directions. when it would fall empty upon the walls or slip from the grip that had held it. As for the engine which Marcellus was bringing up from the platform of ships, and which was called *sambuca* from some resemblance in its shape to the musical instrument, while it was still some distance away as it was being carried to the wall a stone ten talents in weight was discharged at it, and after this a second and a third; some of these, falling upon it with a great crash and sending up a wave, crushed the base of the engine, shook the framework and dislodged it from the barrier, so that Marcellus in perplexity sailed away in his ships and passed the word to his land forces to retire.

In a council of war it was decided to approach the walls, if they could, while it was still night; for they thought that the ropes used by Archimedes, since they gave a powerful impetus, would send the missiles over their heads and would fail in their object at close quarters since there was no space for the cast. But Archimedes, it seems, had long ago prepared for such a contingency engines adapted to all distances and missiles of short range, and through openings in the

^a The σαμβύκη was a triangular musical instrument with four strings. Polybius (viii. 6) states that Marcellus had eight quinqueremes in pairs locked together, and on each pair a "sambuca" had been erected: it served as a penthouse for raising soldiers on to the battlements.

wall, small in size but many and continuous, short-ranged engines called scorpions could be trained on objects close at hand without being seen by the enemy.

When, therefore, the Romans approached the walls, thinking to escape notice, once again they were met by the impact of many missiles; stones fell down on them almost perpendicularly, the wall shot out arrows at them from all points, and they withdrew to the rear. Here again, when they were drawn up some distance away, missiles flew forth and caught them as they were retiring, and caused much destruction among them; many of the ships, also, were dashed together and they could not retaliate upon the enemy. For Archimedes had made the greater part of his engines under the wall, and the Romans seemed to be fighting against the gods, inasmuch as countless evils were poured upon them from an unseen source.

Nevertheless Marcellus escaped, and, twitting his artificers and craftsmen, he said: "Shall we not cease fighting against this geometrical Briareus, who uses our ships like cups to ladle water from the sea, who has whipped our sambuca and driven it off in disgrace, and who outdoes all the hundred-handed monsters of fable in hurling so many missiles against us all at once?" For in reality all the other Syracusans were only a body for Archimedes' apparatus, and his the one soul moving and turning everything: all other weapons lay idle, and the city then used his alone, both for offence and for defence. In the end the Romans became so filled with fear that, if they saw a little piece of rope or of wood projecting over

Τηλικοῦτον μέντοι φρόνημα καὶ βάθος ψυχῆς καὶ τοσοῦτον ἐκέκτητο θεωρημάτων πλοῦτον `Αρχιμήδης ὥστε, ἐφ' οἶς ὄνομα καὶ δόξαν οὐκ ἀνθρωπίνης, ἀλλὰ δαιμονίου τινὸς ἔσχε συνέσεως, μηθέν εθελήσαι σύγγραμμα περί τούτων απολιπείν, άλλὰ τὴν περὶ τὰ μηχανικὰ πραγματείαν καὶ πᾶσαν όλως τέχνην χρείας έφαπτομένην άγεννη καὶ βάναυσον ήγησάμενος, εἰς ἐκεῖνα καταθέσθαι μόνα την αύτου φιλοτιμιάν οίς το καλον και περιττον άμιγές τοῦ ἀναγκαίου πρόσεστιν, ἀσύγκριτα μέν οντα τοις άλλοις, έριν δε παρέχοντα προς την ύλην τῆ ἀποδείξει, τῆς μὲν τὸ μέγεθος καὶ τὸ κάλλος, τῆς δὲ τὴν ἀκρίβειαν καὶ τὴν δύναμιν ὑπερφυῆ παρεχομένης οὐ γὰρ ἔστιν ἐν γεωμετρία χαλεπωτέρας καὶ βαρυτέρας ὑποθέσεις ἐν ἀπλουστέροις λαβεῖν καὶ καθαρωτέροις στοιχείοις γραφομένας. καὶ τοῦθ' οἱ μὲν εὐφυΐα τοῦ ἀνδρὸς προσάπτουσιν, οί δὲ ὑπερβολῆ τινι πόνου νομίζουσιν ἀπόνως πεποιημένω και ραδίως εκαστον εοικός γεγονέναι. ζητῶν μὲν γὰρ οὖκ ἄν τις εὕροι δι' αὐτοῦ τὴν ἀπόδειξιν, ἄμα δὲ τῆ μαθήσει παρίσταται δόξα τοῦ καν αὐτὸν εύρεῖν οὕτω λείαν όδον ἄγει καὶ ταχείαν έπὶ τὸ δεικνύμενον. οὔκουν οὐδὲ ἀπιστῆσαι τοις περί αὐτοῦ λεγομένοις ἐστίν, ὡς ὑπ' οἰκείας δή τινος καὶ συνοίκου θελγόμενος ἀεὶ σειρῆνος ἐλέληστο καὶ σίτου καὶ θεραπείας σώματος ἐξέλειπε, βία δὲ πολλάκις έλκομενος ἐπ' ἄλειμμα καὶ

the wall, they cried, "There it is, Archimedes is training some engine upon us," and fled; seeing this Marcellus abandoned all fighting and assault, and for the future relied on a long siege.

Yet Archimedes possessed so lofty a spirit, so profound a soul, and such a wealth of scientific inquiry, that although he had acquired through his inventions a name and reputation for divine rather than human intelligence, he would not deign to leave behind a single writing on such subjects. Regarding the business of mechanics and every utilitarian art as ignoble and vulgar, he gave his zealous devotion only to those subjects whose elegance and subtlety are untranmelled by the necessities of life; these subjects, he held, cannot be compared with any others; in them the subject-matter vies with the demonstration, the former possessing strength and beauty, the latter precision and surpassing power; for it is not possible to find in geometry more difficult and weighty questions treated in simpler and purer terms. Some attribute this to the natural endowments of the man, others think it was the result of exceeding labour that everything done by him appeared to have been done without labour and with ease. For although by his own efforts no one could discover the proof, yet as soon as he learns it, he takes credit that he could have discovered it: so smooth and rapid is the path by which he leads to the conclusion. For these reasons there is no need to disbelieve the stories told about him—how, continually bewitched by some familiar siren dwelling with him, he forgot his food and neglected the care of his body; and how, when he was dragged by main force, as often happened, to the

λουτρόν, ἐν ταῖς ἐσχάραις ἔγραφε σχήματα τῶν γεωμετρικῶν, καὶ τοῦ σώματος ἀληλιμμένου διῆγε τῷ δακτύλῳ γραμμάς, ὑπὸ ἡδονῆς μεγάλης κάτοχος ῶν καὶ μουσόληπτος ἀληθῶς. πολλῶν δὲ καὶ καλῶν εὑρετὴς γεγονὼς λέγεται τῶν φίλων δεηθηναι καὶ τῶν συγγενῶν ὅπως αὐτοῦ μετὰ τὴν τελευτὴν ἐπιστήσωσι τῷ τάφῳ τὸν περιλαμβάνοντα τὴν σφαῖραν ἐντὸς κύλινδρον, ἐπιγράψαντες τὸν λόγον τῆς ὑπεροχῆς τοῦ περιέχοντος στερεοῦ πρὸς τὸ περιεχόμενον.

Ibid. xix. 4-6

Μάλιστα δὲ τὸ ᾿Αρχιμήδους πάθος ἠνίασε Μάρκελλον. ἔτυχε μὲν γὰρ αὐτός τι καθ᾽ ἑαυτὸν ἀνασκοπῶν ἐπὶ διαγράμματος καὶ τἢ θεωρία δεδωκὼς ἄμα τὴν τε διάνοιαν καὶ τὴν πρόσοι μιν οὐ προήσθετο τὴν καταδρομὴν τῶν ὙΡωμαίων οὐδὲ τὴν ἄλωσιν τῆς πόλεως, ἄφνω δὲ ἐπιστάντος αὐτῷ στρατιώτου καὶ κελεύοντος ἀκολουθεῖν πρὸς Μάρκελλον οὐκ ἐβούλετο πρὶν ἢ τελέσαι τὸ πρόβλημα καὶ καταστῆσαι πρὸς τὴν ἀπόδειξιν. ὁ δὲ ὀργισθεὶς καὶ σπασάμενος τὸ ξίφος ἀνεῖλεν αὐτόν. ἔτεροι μὲν οὖν λέγουσιν ἐπιστῆναι μὲν εὐθὺς ὡς ἀποκτενοῦντα ξιφήρη τὸν ὙΡωμαῖον, ἐκεῖνον δ᾽ ἰδόντα δεῖσθαι καὶ ἀντιβολεῖν ἀναμεῖναι βραχὺν χρόνον, ὡς μὴ καταλίπη τὸ ζητούμενον ἀτελὲς καὶ ἀθεώρητον, τὸν δὲ οὐ φροντίσαντα διαχρήσασθαι. καὶ τρίτος ἐστὶ λόγος, ὡς κομίζοντι πρὸς Μάρκελλον αὐτῷ τῶν μαθηματικῶν ὀργάνων σκιόθηρα καὶ σφαίρας καὶ γωνίας, αἷς ἐναρμόττει

Cicero, when quaestor in Sicily, found this tomb over-32

place for bathing and anointing, he would draw geometrical figures in the hearths, and draw lines with his finger in the oil with which his body was anointed, being overcome by great pleasure and in truth inspired of the Muses. And though he made many elegant discoveries, he is said to have besought his friends and kinsmen to place on his grave after his death a cylinder enclosing a sphere, with an inscription giving the proportion by which the including solid exceeds the included.⁴

Ibid. xix. 4-6

But what specially grieved Marcellus was the death of Archimedes. For it chanced that he was alone, examining a diagram closely; and having fixed both his mind and his eyes on the object of his inquiry, he perceived neither the inroad of the Romans nor the taking of the city. Suddenly a soldier came up to him and bade him follow to Marcellus, but he would not go until he had finished the problem and worked it out to the demonstration. Thereupon the soldier became enraged, drew his sword and dispatched Others, however, say that the Roman came upon him with drawn sword intending to kill him at once, and that Archimedes, on seeing him, besought and entreated him to wait a little while so that he might not leave the question unfinished and only partly investigated; but the soldier did not understand and slew him. There is also a third story, that as he was carrying to Marcellus some of his mathematical instruments, such as sundials, spheres and

grown with vegetation, but still bearing the cylinder with the sphere, and he restored it (*Tusc. Disp.* v. 64-66). The theorem proving the proportion is given *infra*, pp. 124-127.

1 λέγεται om. Hultsch.

^a Diodorus is writing of the Island in the delta of the Nile.
^b It may be inferred that he studied with the successors of Fuelid at Alexandria, and it was there perhaps that he made the acquaintance of Conon of Samos, to whom, as 34

angles adjusted to the apparent size of the sun, some soldiers fell in with him and, under the impression that he carried treasure in the box, killed him. What is, however, agreed is that Marcellus was distressed, and turned away from the slayer as from a polluted person, and sought out the relatives of Archimedes to do them honour.

Pappus, Collection viii. 11. 19, ed. Hultsch 1060. 1-4

To the same type of inquiry belongs the problem: To move a given weight by a given force. This is one of Archimedes' discoveries in mechanics, whereupon he is said to have exclaimed: "Give me somewhere to stand and I will move the earth."

Diodorus Siculus i. 34. 2

As it is made of silt watered by the river after being deposited, it a bears an abundance of fruits of all kinds; for in the annual rising the river continually pours over it fresh alluvium, and men easily irrigate the whole of it by means of a certain instrument conceived by Archimedes of Syracuse, and which gets its name because it has the form of a spiral or *screw*.

Ibid. v. 37. 3

Most remarkable of all, they draw off streams of water by the so-called Egyptian screws, which Archimedes of Syracuse invented when he went by ship to Egypt."

the preface to his books On the Sphere and Cylinder shows, he used to communicate his discoveries before publication, and Eratosthenes of Cyrene, to whom he sent the Method and probably the Cattle Problem.

Vitr. De Arch. ix., Praef. 9-12

Archimedis vero cum multa miranda inventa et varia fuerint, ex omnibus etiam infinita sollertia id quod exponam videtur esse expressum. Hiero Syracusis auctus regia potestate, rebus bene gestis cum auream coronam votivam diis immortalibus in quodam fano constituisset ponendam, manupretio locavit faciendam et aurum ad sacoma adpendit redemptori. Is ad tempus opus manu factum subtiliter regi adprobavit et ad sacoma pondus coronae visus est praestitisse. Posteaquam indicium est factum dempto auro tantundem argenti in id coronarium opus admixtum esse, indignatus Hiero se contemptum esse neque inveniens qua ratione id furtum deprehenderet, rogavit Archimeden uti insumeret sibi de eo cogitationem. Tunc is cum haberet eius rei curam, casu venit in balineum ibique cum in solium descenderet, animadvertit quantum corporis sui in eo insideret tantum aquae extra solium effluere. cum eius rei rationem explicationis ostendisset, non est moratus sed exsiluit gaudio motus de solio et nudus vadens domum versus significabat clara voce invenisse quod quaereret. Nam currens identidem graece clamabat εξρηκα εξρηκα.

Tum vero ex eo inventionis ingressu duas fecisse dicitur massas aequo pondere quo etiam fuerat corona, unam ex auro et alteram ex argento. Cum ita fecisset, vas amplum ad summa labra implevit

[&]quot; I have found, I have found."

Vitruvius, On Architecture ix., Preface 9-1

Archimedes made many wonderful discoveries of different kinds, but of all these that which I shall now explain seems to exhibit a boundless ingenuity. When Hiero was greatly exalted in the royal power at Syracuse, in return for the success of his policy he determined to set up in a certain shrine a golden crown as a votive offering to the immortal gods. He let out the work for a stipulated payment, and weighed out the exact amount of gold for the contractor. appointed time the contractor brought his work skilfully executed for the king's approval, and he seemed to have fulfilled exactly the requirement about the weight of the crown. Later information was given that gold had been removed and an equal weight of silver added in the making of the crown. Hiero was indignant at this disrespect for himself, and, being unable to discover any means by which he might unmask the fraud, he asked Archimedes to give it his attention. While Archimedes was turning the problem over, he chanced to come to the place of bathing, and there, as he was sitting down in the tub, he noticed that the amount of water which flowed over the tub was equal to the amount by which his body was immersed. This indicated to him a means of solving the problem, and he did not delay, but in his joy leapt out of the tub and, rushing naked towards his home, he cried out with a loud voice that he had found what he sought. For as he ran he repeatedly shouted in Greek, heureka, heureka.a

Then, following up his discovery, he is said to have made two masses of the same weight as the crown, the one of gold and the other of silver. When he had so done, he filled a large vessel right up to the brim

aqua, in quo demisit argenteam massam. Cuius quanta magnitudo in vase depressa est, tantum aquae effluxit. Ita exempta massa quanto minus factum fuerat refudit sextario mensus, ut eodem modo quo prius fuerat ad labra aequaretur. Ita ex eo invenit quantum pondus argenti ad certam aquae mensuram responderet.

Cum id expertus esset, tum auream massam similiter pleno vase demisit et ea exempta eadem ratione mensura addita invenit deesse aquae non tantum sed minus, quanto minus magno corpore eodem pondere auri massa esset quam argenti. Postea vero repleto vase in eadem aqua ipsa corona denissa invenit plus aquae defluxisse in coronam quam in auream eodem pondere massam, et ita ex eo quod defuerit plus aquae in corona quam in massa, ratiocinatus deprehendit argenti in auro mixtionem et manifestum furtum redemptoris.

^a The method may be thus expressed analytically.

Let w be the weight of the crown, and let it be made up of a weight w_1 of gold and a weight w_2 of silver, so that $w = w_1 + w_2$.

Let the crown displace a volume v of water.

Let the weight w of gold displace a volume v_1 of water; then a weight w_1 of gold displaces a volume $\frac{w_1}{w}$. v_1 of water.

Let the weight w of silver displace a volume v_2 of water; 38

with water, into which he dropped the silver mass. The amount by which it was immersed in the vessel was the amount of water which overflowed. Taking out the mass, he poured back the amount by which the water had been depleted, measuring it with a pint pot, so that as before the water was made level with the brim. In this way he found what weight of silver answered to a certain measure of water.

When he had made this test, in like manner he dropped the golden mass into the full vessel. it out again, for the same reason he added a measured quantity of water, and found that the deficiency of water was not the same, but less; and the amount by which it was less corresponded with the excess of a mass of silver, having the same weight, over a mass of gold. After filling the vessel again, he then dropped the crown itself into the water, and found that more water overflowed in the case of the crown than in the case of the golden mass of identical weight; and so, from the fact that more water was needed to make up the deficiency in the case of the crown than in the case of the mass, he calculated and detected the mixture of silver with the gold and the contractor's fraud stood revealed.

then a weight w_2 of silver displaces a volume $\frac{w_2}{w}$, v_2 of water.

$$\begin{array}{ll} \text{ It follows that } & r = \frac{w_1}{w} \cdot v_1 + \frac{w_2}{w} \cdot v_2 \\ & = \frac{w_1 v_1 + w_2 v_2}{w_1 + w_2}, \\ \text{so that } & \frac{w_1}{w_2} = \frac{v_2 - v}{v - v_1}. \end{array}$$

For an alternative method of solving the problem, $v.\ infra$, pp. 248-251.

(b) SURFACE AND VOLUME OF THE CYLINDER AND SPHERE

Archim. De Sphaera et Cyl. i., Archim. ed. Heiberg i. 2-132. 3

Πρότερον μέν ἀπέσταλκά σοι τῶν ὑφ' ἡμῶν τεθεωρημένων γράψας μετά αποδείξεως, ὅτι πᾶν τμήμα τὸ περιεχόμενον ὑπό τε εὐθείας καὶ ὀρθογωνίου κώνου τομής επίτριτόν εστι τριγώνου τοῦ βάσιν την αὐτην ἔχοντος τῷ τμήματι καὶ ὕψος ίσον υστερον δε ήμιν υποπεσόντων θεωρημάτων αξίων λόγου πεπραγματεύμεθα περί τὰς ἀποδείξεις αὐτῶν. ἔστιν δὲ τάδε πρῶτον μέν, ὅτι πάσης σφαίρας ή επιφάνεια τετραπλασία εστίν τοῦ μεγίστου κύκλου των εν αυτή επειτα δε, ότι παντός τμήματος σφαίρας τῆ ἐπιφανεία ἴσος ἐστὶ κύκλος, οὖ ἡ ἐκ τοῦ κέντρου ἴση ἐστὶ τῆ εὐθεία τῆ ἀπὸ της κορυφης του τμήματος αγομένη έπι την περιφέρειαν τοῦ κύκλου, ος ἐστι βάσις τοῦ τμήματος.

¹ ἀξίων λόγου cod., ἀνελέγκτων coni. Heath.

^a The chief results of this book are described in the prefatory letter to Dositheus. In this selection as much as possible is given of what is essential to finding the proportions between the surface and volume of the sphere and the surface and volume of the enclosing cylinder, which Archimedes regarded as his crowning achievement (supra, p. 32). the case of the surface, the whole series of propositions is reproduced so that the reader may follow in detail the majestic chain of reasoning by which Archimedes, starting from seemingly remote premises, reaches the desired conclusion; in the case of the volume only the final proposition (34) can be given, for reasons of space, but the reader will be able to prove the omitted theorems for himself. Pari passu with 40

(b) Surface and Volume of the Cylinder and Sphere

Archimedes. On the Sphere and Cylinder i., Archim. ed. Heiberg i. 2-132. 3 a

Archimedes to Dositheus greeting

On a previous occasion I sent you, together with the proof, so much of my investigations as I had set down in writing, namely, that any segment bounded by a straight line and a section of a right-angled cone is fourthirds of the triangle having the same base as the segment and equal height. Subsequently certain theorems deserving notice occurred to me, and I have worked out the proofs. They are these: first, that the surface of any sphere is four times the greatest of the circles in it c; then, that the surface of any segment of a sphere is equal to a circle whose radius is equal to the straight line drawn from the vertex of the segment to the circumference of the circle which is the base of the segment a, and,

this demonstration, Archimedes finds the surface and volume of any segment of a sphere. The method in each case is to inscribe in the sphere or segment of a sphere, and to circumscribe about it, figures composed of cones and frusta of cones. The sphere or segment of a sphere is intermediate in surface and volume between the inscribed and circumscribed figures, and in the limit, when the number of sides in the inscribed and circumscribed figures is indefinitely increased, it would become identical with them. It will readily be appreciated that Archimedes' method is fundamentally the same as integration, and on p. 116 n. b this will be shown trigonometrically.

^b This is proved in Props. 17 and 24 of the *Quadrature of the Porabola*, sent to Dositheus of Pelusium with a prefatory letter, v. pp. 228-243, infra.

The Sphaera et Cul. i. 30. "The greatest of the circles,"

here and elsewhere, is equivalent to "a great circle."

^d Ibid. i. 12, 43.

πρὸς δὲ τούτοις, ὅτι πάσης σφαίρας ὁ κύλινδρος ὁ βάσιν μεν έχων ίσην τω μεγίστω κύκλω των εν τη σφαίρα, ύψος δὲ ἴσον τῆ διαμέτρω τῆς σφαίρας αὐτός τε ἡμιόλιός ἐστιν τῆς σφαίρας, καὶ ἡ ἐπι-φάνεια αὐτοῦ τῆς ἐπιφανείας τῆς σφαίρας. ταῦτα δὲ τὰ συμπτώματα τῆ φύσει προυπῆρχεν περὶ τὰ είρημένα σχήματα, ήγνοείτο δε ύπο των προ ήμων περί γεωμετρίαν ανεστραμμένων οὐδενὸς αὐτῶν έπινενοηκότος, ότι τούτων τῶν σχημάτων ἐστὶν συμμετρία. . . . έξέσται δὲ περί τούτων ἐπισκέψασθαι τοις δυνησομένοις. ὤφειλε μεν οὖν Κόνωνος έτι ζώντος εκδίδοσθαι ταθτα τήνον γάρ ύπολαμβάνομέν που μάλιστα ἂν δύνασθαι κατανοῆσαι ταθτα καὶ τὴν άρμόζουσαν ὑπὲρ αὐτῶν απόφασιν ποιήσασθαι δοκιμάζοντες δέ καλώς έχειν μεταδιδόναι τοῖς οἰκείοις τῶν μαθημάτων άποστέλλομέν σοι τὰς ἀποδείξεις ἀναγράψαντες, ύπερ ων εξέσται τοῖς περί τὰ μαθήματα ἀναστρεφομένοις ἐπισκέψασθαι. ἐρρωμένως.

Γράφονται πρῶτον τά τε ἀξιώματα καὶ τὰ λαμβα-

νόμενα είς τὰς ἀποδείξεις αὐτῶν.

'Αξιώματα

α΄. Εἰσί τινες ἐν ἐπιπέδω καμπύλαι γραμμαὶ πεπερασμέναι, αι τῶν τὰ πέρατα ἐπιζευγνυουσῶν αὐτῶν εὐθειῶν ἤτοι ὅλαι ἐπὶ τὰ αὐτά εἰσιν ἢ οὐδὲν ἔχουσιν ἐπὶ τὰ ἔτερα.

β΄. Ἐπὶ τὰ αὐτὰ δὴ κοίλην καλῶ τὴν τοιαύτην γραμμήν, ἐν ἡ ἐὰν δύο σημείων λαμβανομένων

 $[^]a$ De Sphaera et Cyl. i. 34 coroll. The surface of the cylinder here includes the bases.

further, that, in the case of any sphere, the cylinder having its base equal to the greatest of the circles in the sphere, and height equal to the diameter of the sphere, is one-and-a-half times the sphere, and its surface is oneand-a-half times the surface of the sphere.^a Now these properties were inherent in the nature of the figures mentioned, but they were unknown to all who studied geometry before me, nor did any of them suspect such a relationship in these figures. b . . . But now it will be possible for those who have the capacity to examine these discoveries of mine. They ought to have been published while Conon was still alive, for I opine that he more than others would have been able to grasp them and pronounce a fitting verdict upon them; but, holding it well to communicate them to students of mathematics, I send you the proofs that I have written out, which proofs will now be open to those who are conversant with mathematics. Farewell.

In the first place, the axioms and the assumptions used for the proofs of these theorems are here set out.

AXIOMS C

- 1. There are in a plane certain finite bent lines which either lie wholly on the same side of the straight lines joining their extremities or have no part on the other side.
- 2. I call concave in the same direction a line such that, if any two points whatsoever are taken on it, either

^b In the omitted passage which follows, Archimedes compares his discoveries with those of Eudoxus; it has already been given, vol. i. pp. 408-411.

^c These so-called axioms are more in the nature of de-

finitions.

όποιωνοῦν αἱ μεταξὺ τῶν σημείων εὐθεῖαι ήτοι πασαι ἐπὶ τὰ αὐτὰ πίπτουσιν τῆς γραμμῆς, ἢ τινές μεν έπὶ τὰ αὐτά, τινές δε κατ' αὐτης, ἐπὶ τὰ έτερα δὲ μηδεμία.

γ'. 'Ομοίως' δη καὶ ἐπιφάνειαί τινές εἰσιν πεπερασμέναι, αὐταὶ μὲν οὐκ ἐν ἐπιπέδω, τὰ δὲ πέρατα ἔχουσαι ἐν ἐπιπέδω, αι τοῦ ἐπιπέδου, ἐν ῷ τὰ πέρατα ἔχουσιν, ἤτοι ὅλαι ἐπὶ τὰ αὐτὰ ἔσονται ἢ οὐδὲν ἔχουσιν ἐπὶ τὰ ἔτερα.

δ΄. Ἐπὶ τὰ αὐτὰ δὴ κοίλας καλῶ τὰς τοιαύτας έπιφανείας, έν αίς αν δύο σημείων λαμβανομένων αί μεταξύ τῶν σημείων εὐθεῖαι ήτοι πᾶσαι ἐπὶ τὰ αὐτὰ πίπτουσιν τῆς ἐπιφανείας, ἢ τινὲς μὲν ἐπὶ τὰ αὐτά, τινὲς δὲ κατ' αὐτῆς, ἐπὶ τὰ ἔτερα δὲ μηδεμία.

ε΄. Τομέα δὲ στερεὸν καλῶ, ἐπειδὰν σφαῖραν κῶνος τέμνη κορυφὴν ἔχων πρὸς τῷ κέντρω της σφαίρας, τὸ ἐμπεριεχόμενον σχημα ὑπό τε της επιφανείας τοῦ κώνου καὶ της επιφανείας της

σφαίρας έντὸς τοῦ κώνου.

ς΄. 'Ρόμβον δὲ καλῶ στερεόν, ἐπειδὰν δύο κῶνοι την αὐτην βάσιν ἔχοντες τὰς κορυφὰς ἔχωσιν ἐφ' έκάτερα τοῦ ἐπιπέδου τῆς βάσεως, ὅπως οἱ ἄξονες αὐτῶν ἐπ' εὐθείας ὧοι κείμενοι, τὸ ἐξ ἀμφοῖν τοῖν κώνοιν συγκείμενον στερεόν σγημα.

Λαμβανόμενα

Λαμβάνω δὲ ταῦτα·

α'. Τῶν τὰ αὐτὰ πέρατα ἐχουσῶν γραμμῶν έλαχίστην είναι την εύθεῖαν.

all the straight lines joining the points fall on the same side of the line, or some fall on one and the same side while others fall along the line itself, but none fall on the other side.

- 3. Similarly also there are certain finite surfaces, not in a plane themselves but having their extremities in a plane, and such that they will either lie wholly on the same side of the plane containing their extremities or will have no part on the other side.
- 4. I call concave in the same direction surfaces such that, if any two points on them are taken, either the straight lines between the points all fall upon the same side of the surface, or some fall on one and the same side while others fall along the surface itself, but none falls on the other side.
- 5. When a cone cuts a sphere, and has its vertex at the centre of the sphere, I call the figure comprehended by the surface of the cone and the surface of the sphere within the cone a *solid sector*.
- 6. When two cones having the same base have their vertices on opposite sides of the plane of the base in such a way that their axes lie in a straight line, I call the solid figure formed by the two cones a solid rhombus.

POSTULATES

I make these postulates:

- 1. Of all lines which have the same extremities the straight line is the least.^a
- ^a Proclus (in Eucl., ed. Friedlein 110. 10-14) saw in this statement a connexion with Fuclid's definition of a straight line as lying evenly with the points on itself: δ δ' $a\bar{v}$ Άρχιμήδης τὴν εὐθεῖαν ώρίσατο γραμμὴν ἐλαχίστην τῶν τὰ αὐτὰ πέρατα ἐχουσῶν. διότι γάρ, ὡς ὁ Γ.ὑκλείδιος λόγος φησίν, ἐξ ἴσου κεῖται τοῖς ἐφ' ἑαυτῆς σημείοις, διὰ τοῦτο ἐλαχίστη ἐστὶν τῶν τὰ αὐτὰ πέρατα ἐχουσῶν.

β΄. Τῶν δὲ ἄλλων γραμμῶν, ἐὰν ἐν ἐπιπέδῳ οὖσαι τὰ αὐτὰ πέρατα ἔχωσιν, ἀνίσους εἶναι τὰς τοιαύτας, ἐπειδὰν ὧσιν ἀμφότεραι ἐπὶ τὰ αὐτὰ κοῖλαι, καὶ ἤτοι ὅλη περιλαμβάνηται ἡ ἑτέρα αὐτῶν ὑπὸ τῆς ἐτέρας καὶ τῆς εὐθείας τῆς τὰ αὐτὰ πέρατα ἐχούσης αὐτῆ, ἢ τινὰ μὲν περιλαμβάνηται, τινὰ δὲ κοινὰ ἔχη, καὶ ἐλάσσονα εἶναι τὴν περιλαμβανομένην.

γ΄. Ὁμοίως δὲ καὶ τῶν ἐπιφανειῶν τῶν τὰ αὐτὰ πέρατα ἐχουσῶν, ἐὰν ἐν ἐπιπέδῳ τὰ πέρατα

έχωσιν, ελάσσονα είναι τὴν ἐπίπεδον.

δ΄. Τῶν δὲ ἄλλων ἐπιφανειῶν καὶ τὰ αὐτὰ πέρατα ἐχουσῶν, ἐὰν ἐν ἐπιπέδω τὰ πέρατα ἢ, ἀνίσους εἶναι τὰς τοιαύτας, ἐπειδὰν ὧσιν ἀμφότεραι ἐπὶ τὰ αὐτὰ κοῖλαι, καὶ ἤτοι ὅλη περιλαμβάνηται ὑπὸ τῆς ἐτέρας ἡ ἐτέρα ἐπιφάνεια καὶ τῆς ἐπιπέδου τῆς τὰ αὐτὰ πέρατα ἐχούσης αὐτῆ, ἢ τινὰ μὲν περιλαμβάνηται, τινὰ δὲ κοινὰ ἔχῃ, καὶ ἐλάσσονα εἶναι τὴν περιλαμβανομένην.

ε΄. "Ετι δε των ανίσων γραμμων καὶ των ανίσων επιφανειων καὶ των ανίσων στερεων το μεῖζον τοῦ ελάσσονος ὑπερέχειν τοιούτω, ὁ συντιθέμενον αὐτὸ έαυτῷ δυνατόν ἐστιν ὑπερέχειν παντὸς τοῦ προ-

τεθέντος των πρός ἄλληλα λεγομένων.

Τούτων δὲ ὑποκειμένων, ἐὰν εἰς κύκλον πολύγωνον ἐγγραφῆ, φανερόν, ὅτι ἡ περίμετρος τοῦ ἐγγραφέντος πολυγώνου ἐλάσσων ἐστὶν τῆς τοῦ κύκλου περιφερείας ἐκάστη γὰρ τῶν τοῦ πολυγώνου πλευρῶν ἐλάσσων ἐστὶ τῆς τοῦ κύκλου περιφερείας τῆς ὑπὸ τῆς αὐτῆς ἀποτεμνομένης.

^a This famous "Axiom of Archimedes" is, in fact, generally used by him in the alternative form in which it is proved 46

2. Of other lines lying in a plane and having the same extremities, [any two] such are unequal when both are concave in the same direction and one is either wholly included between the other and the straight line having the same extremities with it, or is partly included by and partly common with the other; and the included line is the lesser.

3. Similarly, of surfaces which have the same extremities, if those extremities be in a plane, the

plane is the least.

4. Of other surfaces having the same extremities, if the extremities be in a plane, [any two] such are unequal when both are concave in the same direction, and one surface is either wholly included between the other and the plane having the same extremities with it, or is partly included by and partly common with the other; and the included surface is the lesser.

5. Further, of unequal lines and unequal surfaces and unequal solids, the greater exceeds the less by such a magnitude as, when added to itself, can be made to exceed any assigned magnitude among those

comparable with one another.a

With these premises, if a polygon be inscribed in a circle, it is clear that the perimeter of the inscribed polygon is less than the circumference of the circle; for each of the sides of the polygon is less than the arc of the circle cut off by it.

in Fuclid x. 1, for which v. vol. i. pp. 452-455. The axiom can be shown to be equivalent to Dedekind's principle, that a section of the rational points in which they are divided into two classes is made by a single point. Applied to straight lines, it is equivalent to saying that there is a complete correspondence between the aggregate of real numbers and the aggregate of points in a straight line; v. E. W. Hobson, The Theory of Functions of a Real Variable, 2nd ed., vol. i. p. 55.

a'

Έὰν περὶ κύκλον πολύγωνον περιγραφῆ, ἡ τοῦ περιγραφέντος πολυγώνου περίμετρος μείζων ἐστὶν τῆς περιμέτρου τοῦ κύκλου.

Περὶ γὰρ κύκλον πολύγωνον περιγεγράφθω τὸ ὑποκείμενον. λέγω, ὅτι ἡ περίμετρος τοῦ πολυγώνου μείζων ἐστὶν τῆς περιμέτρου τοῦ κύκλου.

'Επεὶ γὰρ συναμφότερος ἡ ΒΑΛ μείζων ἐστὶ τῆς ΒΛ περιφερείας διὰ τὸ τὰ αὐτὰ πέρατα ἔχουσαν περιλαμβάνειν τὴν περιφέρειαν, ὁμοίως δὲ καὶ συναμφότερος μὲν ἡ ΔΓ, ΓΒ τῆς ΔΒ, συναμφότερος δὲ ἡ ΛΚ, ΚΘ τῆς ΛΘ, συναμφότερος ἡ ΔΕ, ΕΖ τῆς ΔΖ, ὅλη ἄρα ἡ περίμετρος τοῦ πολυγώνου μείζων ἐστὶ τῆς περιφερείας τοῦ κύκλου.

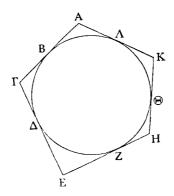

^a It is here indicated, as in Prop. 3, that Archimedes added a figure to his own demonstration.

Prop. 1

If a polygon be circumscribed about a circle, the perimeter of the circumscribed polygon is greater than the

circumference of the circle.

For let the polygon be circumscribed about the circle as below.^a I say that the perimeter of the polygon is greater than the circumference of the circle.

For since

$$BA + A\Lambda > arc B\Lambda$$
,

owing to the fact that they have the same extremities as the arc and include it, and similarly

$$\begin{array}{l} \Delta\Gamma + \Gamma B > [arc] \ \Delta B, \\ \Lambda K + K \theta > [arc] \ \Lambda \theta, \\ ZH + H \theta > [arc] \ Z\theta, \\ \Delta E + EZ > [arc] \ \Delta Z, \end{array}$$

and further

therefore the whole perimeter of the polygon is greater than the circumference of the circle.

В

Prop. 2

Given two unequal magnitudes, it is possible to find two unequal straight lines such that the greater straight line has to the less a ratio less than the greater magnitude has to the less.

Let AB, Δ be two unequal magnitudes, and let ΛB be the greater. I say that it is possible to find two unequal straight lines satisfying the aforesaid requirement.

By the second proposition in the first book of Euclid let B Γ be placed equal to Δ , and let ZH be any straight line; then ΓA , if added to itself, will exceed Δ . [Post. 5.] Let it be multiplied, therefore, and let the result be $A\theta$, and as $A\theta$ is to $A\Gamma$, so let ZH be to HE; therefore

 $\Theta A : A\Gamma = ZH : HE$ [cf. Eucl. v. 15]

and conversely, EH: $HZ = A\Gamma : A\Theta$.

[Eucl. v. 7, coroll.

And since $A\theta > \Delta$ $> \Gamma B$. $\Gamma A : A\Theta < \Gamma A : \Gamma B$. therefore [Eucl. v. 8 But $\Gamma A : AO = EH : HZ$; therefore EH: $HZ < \Gamma A : \Gamma B$: $EZ:ZH < AB:B\Gamma.a$ componendo, $B\Gamma = \Delta$: Now $EZ:ZH < AB:\Delta$. therefore

^a This and related propositions are proved by Eutocius [Archim. ed. Heiberg iii. 16. 11–18. 22] and by Pappus, Coll. ed. Hultsch 684. 20 ff. It may be simply proved thus. If a:b < c:d, it is required to prove that a+b:b < c+d:d. Let e be taken so that a:b:e:d. Then e:d < c:d. Therefore e < c, and e+d:d < c+d:d. But e:d:d=a+b:b (ex hypothesi, componendo). Therefore a+b:b < c+d:d.

Εύρημέναι εἰσὶν ἄρα δύο εὐθεῖαι ἄνισοι ποιοῦσαι τὸ εἰρημένον ἐπίταγμα [τουτέστιν τὴν μείζονα πρὸς τὴν ἐλάσσονα λόγον ἔχειν ἐλάσσονα ἢ τὸ μεῖζον μέγεθος πρὸς τὸ ἔλασσον].¹

 γ'

Δύο μεγεθῶν ἀνίσων δοθέντων καὶ κύκλου δυνατόν ἐστιν εἰς τὸν κύκλον πολύγωνον ἐγγράψαι καὶ ἄλλο περιγράψαι, ὅπως ἡ τοῦ περιγραφομένου πολυγώνου πλευρὰ πρὸς τὴν τοῦ ἐγγραφομένου πολυγώνου πλευρὰν ἐλάσσονα λόγον ἔχη ἢ τὸ μεῖζον μέγεθος πρὸς τὸ ἔλαττον.

"Έστω τὰ δοθέντα δύο μεγέθη τὰ Α, Β, ὁ δὲ δοθεὶς κύκλος ὁ ὑποκείμενος. λέγω οὖν, ὅτι

δυνατόν έστι ποιείν το ἐπίταγμα.

Εύρήσθωσαν γὰρ δύο εὐθεῖαι αἱ Θ, ΚΛ, ὧν μείζων ἔστω ἡ Θ, ὥστε τὴν Θ πρὸς τὴν ΚΛ

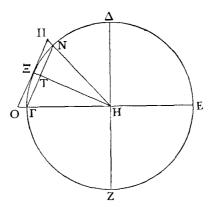

Accordingly there have been discovered two unequal straight lines fulfilling the aforesaid requirement.

Prop. 3

Given two unequal magnitudes and a circle, it is possible to inscribe a [regular] polygon in the circle and to circumscribe another, in such a manner that the side of the circumscribed polygon has to the side of the inscribed polygon a ratio less than that which the greater magnitude has to the less.

Let A, B be the two given magnitudes, and let the

given circle be that set out below. I say then that it is possible to do what is required.

For let there be found two straight lines θ , $K\Lambda$, of which θ is the greater, such that θ has to $K\Lambda$ a ratio

¹ τουτέστιν . . . ἔλασσον verba subditiva esse suspicatur Heiberg.

έλάσσονα λόγον έχειν η τὸ μεῖζον μέγεθος πρὸς τὸ έλαττον, καὶ ἤχθω ἀπὸ τοῦ Λ τῆ ΛΚ πρὸς ὀρθὰς ελαττον, και ηχοω από του Λ τη $\Lambda \Lambda$ προς οροας ή ΛM , και ἀπό του Λ τη Θ ἴση κατήχθω ή KM [δυνατόν γὰρ τοῦτο], και ηχθωσαν τοῦ κύκλου δύο διάμετροι πρὸς ὀρθὰς ἀλλήλαις αι ΓE , ΔZ . τέμνοντες οὖν τὴν ὑπὸ τῶν $\Delta H \Gamma$ γωνίαν δίχα και τὴν ἡμίσειαν αὐτῆς δίχα καὶ αἰεὶ τοῦτο ποιοῦντες λείψομέν τινα γωνίαν ελάσσονα η διπλασίαν της ύπὸ ΛΚΜ. λελείφθω καὶ ἔστω ἡ ύπὸ ΝΗΓ, καὶ ἐπεζεύχθω ἡ ΝΓ· ἡ ἄρα ΝΓ πολυγώνου ἐστὶ πλευρὰ ἰσοπλεύρου [ἐπείπερ ἡ ὑπὸ ΝΗΓ γωνία μετρεῖ τὴν ὑπὸ ΔΗΓ ὀρθὴν οὖσαν, καὶ ἡ ΝΓ ἄρα περιφέρεια μετρεῖ τὴν ΓΔ συσαν, και η 181 αρα περιφερεια μετρεί την ΓΔ τέταρτον οὖσαν κύκλου ωστε καὶ τὸν κύκλον μετρεῖ. πολυγώνου ἄρα ἐστὶ πλευρὰ ἰσοπλεύρου φανερὸν γάρ ἐστι τοῦτο].² καὶ τετμήσθω ἡ ὑπὸ ΓΗΝ γωνία δίχα τῆ ΗΞ εὐθεία, καὶ ἀπὸ τοῦ Ξ τη τωνια οιχα τη τω ευυεια, και από του ω εφαπτέσθω τοῦ κύκλου ή ΟΞΠ, καὶ εκβεβλήσθωσαν αἱ ΗΝΠ, ΗΓΟ· ὤστε καὶ ή ΠΟ πολυγώνου εστὶ πλευρὰ τοῦ περιγραφομένου περὶ τὸν κύκλον καὶ ἰσοπλεύρου [φανερόν, ὅτι καὶ ὁμοίου τῷ ἐγγραφομένῳ, οῦ πλευρὰ ἡ ΝΓ]. ἐπεὶ δὲ ἐλάσσων ἐστὶν ἢ διπλασία ἡ ὑπὸ ΝΗΓ τῆς ὑπὸ ΛΚΜ, διπλασία δὲ τῆς ὑπὸ ΤΗΓ, ἐλάσσων ἄρα ἡ ὑπὸ ΤΗΓ τῆς ὑπὸ ΛΚΜ. καί εἰσιν ὀρθαὶ αἰ πρός τοῖς Λ, Τ΄ ἡ ἄρα ΜΚ πρός ΛΚ μείζονα λόγον ἔχει ἤπερ ἡ ΓΗ πρὸς ΗΤ. Ἱση δὲ ἡ ΓΗ τῆ ΗΞ· ωστε ή ΗΞ πρὸς ΗΤ ἐλάσσονα λόγον ἔχει, τουτέστιν ή ΠΟ πρὸς ΝΓ, ἤπερ ή ΜΚ πρὸς ΚΛ ἔτι δὲ ή ΜΚ πρὸς ΚΛ ἐλάσσονα λόγον ἔχει ἤπερ το Α προς το Β. καί έστιν ή μεν ΠΟ πλευρά

less than that which the greater magnitude has to the less [Prop. 2], and from Λ let ΛM be drawn at right angles to AK, and from K let KM be drawn equal to θ , and let there be drawn two diameters of the circle, ΓE , ΔZ , at right angles one to another. If we bisect the angle $\Delta H\Gamma$ and then bisect the half and so on continually we shall leave a certain angle less than double the angle AKM. Let it be left and let it be the angle NH Γ , and let N Γ be joined; then $N\Gamma$ is the side of an equilateral polygon. Let the angle ΓHN be bisected by the straight line HΞ, and through E let the tangent OEII be drawn, and let HNII, HIO be produced; then IIO is a side of an equilateral polygon circumscribed about the circle. Since the angle $NH\Gamma$ is less than double the angle Λ KM and is double the angle TH Γ , therefore the angle TH Γ is less than the angle AKM. And the angles at Λ , T are right; therefore

 $MK: \Lambda K \! > \! \Gamma H: HT \boldsymbol{.^a}$

But $\Gamma H = H\Xi$.

Therefore $H\Xi: HT < MK: K\Lambda$,

that is, $\Pi O: N\Gamma < MK: K\Lambda.^b$

Further, $MK : K\Lambda < A : B.^{\sigma}$ [Therefore $IIO : N\Gamma < A : B.$]

^c For by hypothesis $\Theta: K\Lambda < \Lambda: B$, and $\Theta = MK$.

^a This is proved by Eutocius and is equivalent to the assertion that if $\alpha < \beta \le \frac{\pi}{0}$, cosec $\beta >$ cosec α .

^b For $H\Xi:HT=\Pi O:N\Gamma$, since $H\Xi:HT=O\Xi:\Gamma T=2O\Xi:2\Gamma T=\Pi O:\Gamma N$.

Έαν κώνου τινός ἰσοσκελοῦς εἰς τὸν κύκλον, ὅς ἐστι βάσις τοῦ κώνου, εὐθεῖα γραμμὴ ἐμπέση, ἀπὸ δὲ τῶν περάτων αὐτῆς εὐθεῖαι γραμμαὶ ἀχθῶσιν ἐπὶ τὴν κορυφὴν τοῦ κώνου, τὸ περιληφθὲν τρίγωνον ὑπό τε τῆς ἐμπεσούσης καὶ τῶν ἐπιζευχθεισῶν ἐπὶ τὴν κορυφὴν ἔλασσον ἔσται τῆς 58

less than that which E has to Z [Prop. 2]; if a mean proportional H be taken between Γ , Δ , then Γ will be greater than H [Eucl. vi. 13]. Let a polygon be circumscribed about the circle and another inscribed, so that the side of the circumscribed polygon has to the side of the inscribed polygon a ratio less than that which Γ has to H [Prop. 3]; it follows that the duplicate ratio is less than the duplicate ratio. Now the duplicate ratio of the sides is the ratio of the polygons [Eucl. vi. 20], and the duplicate ratio of Γ to H is the ratio of Γ to Δ [Eucl. v. Def. 9]; therefore the circumscribed polygon has to the inscribed polygon a ratio less than that which Γ has to Δ ; by much more therefore the circumscribed polygon has to the inscribed polygon a ratio less than that which E has to Z.

Prop. 8

If a pyramid be circumscribed about an isosceles cone, the surface of the pyramid nithout the base is equal to a triangle having its base equal to the perimeter of the base [of the pyramid] and its height equal to the side of the cone.

Prop. 9

If in an isosceles cone a straight line [chord] fall in the circle which is the base of the cone, and from its extremities straight lines be drawn to the vertex of the cone, the triangle formed by the chord and the lines joining it to

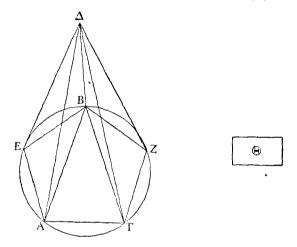

^a The "side of the cone" is a generator. The proof is obvious.

"Εστω δή τὸ Θ ἔλασσον τῶν ΑΒ, ΒΓ τμημάτων. τέμνοντες δή τὰς ΑΒ, ΒΓ περιφερείας δίχα καὶ τὰς ἡμισείας αὐτῶν δίχα λείψομεν τμήματα έλάσσονα ὄντα τοῦ Θ χωρίου. λελείφθω τὰ ἐπὶ τῶν ΑΕ, ΕΒ, ΒΖ, ΖΓ εὐθειῶν, καὶ ἐπεζεύχθωσαν αί ΔΕ, ΔΖ. πάλιν τοίνυν κατά τὰ αὐτὰ ἡ μὲν επιφάνεια τοῦ κώνου ή μεταξὺ τῶν ΑΔΕ μετὰ τοῦ ἐπὶ τῆς ΑΕ τμήματος μείζων ἐστὶν τοῦ ΑΔΕ τριγώνου, ή δὲ μεταξὺ τῶν ΕΔΒ μετὰ τοῦ ἐπὶ της ΕΒ τμήματος μείζων έστὶν τοῦ ΕΔΒ τριγώνου ή ἄρα ἐπιφάνεια ή μεταξὺ τῶν ΑΔΒ μετὰ των έπὶ των ΑΕ, ΕΒ τμημάτων μείζων έστὶν τῶν ΑΔΕ, ΕΒΔ τριγώνων. ἐπεὶ δὲ τὰ ΑΕΔ, ΔΕΒ τρίγωνα μείζονά ἐστιν τοῦ ΑΒΔ τριγώνου, καθώς δέδεικται, πολλώ άρα ή ἐπιφάνεια τοῦ κώνου ή μεταξύ τῶν ΑΔΒ μετὰ τῶν ἐπὶ τῶν ΑΕ. 62

Firstly, let it be not less. Then since there are two surfaces, the surface of the cone between $A\Delta$, ΔB together with the segment ΔEB and the triangle $A\Delta B$, having the same extremity, that is, the perimeter of the triangle A Δ B, the surface which includes the other is greater than the included surface [Post, 3]: therefore the surface of the cone between the straight lines $A\Delta$, ΔB together with the segment AEB is greater than the triangle ABΔ. Similarly the [surface of the cone] between $B\Delta$, $\Delta\Gamma$ together with the segment ΓZB is greater than the triangle $B\Delta\Gamma$; therefore the whole surface of the cone together with the area θ is greater than the aforesaid triangles. Now the aforesaid triangles are equal to the triangle $A\Delta\Gamma$ and the area θ . Let the common area θ be taken away; therefore the remainder, the surface of the cone between $A\Delta$, $\Delta\Gamma$ is greater than the triangle $A\Delta\Gamma$.

Now let Θ be less than the segments AB, B Γ . Bisecting the arcs AB, BI and then bisecting their halves, we shall leave segments less than the area θ [Eucl. xii. 2]. Let the segments so left be those on the straight lines AE, EB, BZ, Z Γ , and let Δ E, Δ Z be ioined. Then once more by the same reasoning the surface of the cone between A1, 1E together with the segment AE is greater than the triangle $A\Delta E$, while that between $E\Delta$, ΔB together with the segment EB is greater than the triangle E Δ B; therefore the surface between A Δ , ΔB together with the segments AE, EB is greater than the triangles $A\Delta E$, Now since the triangles AE Δ , Δ EB are greater than the triangle ABA, as was proved, by much more therefore the surface of the cone between $A\Delta$, ΔB together with the segments AE, EB is

ΕΒ τμημάτων μείζων ἐστὶ τοῦ $A\Delta B$ τριγώνου. διὰ τὰ αὐτὰ δὴ καὶ ἡ ἐπιφάνεια ἡ μεταξὺ τῶν $B\Delta \Gamma$ μετὰ τῶν ἐπὶ τῶν BZ, $Z\Gamma$ τμημάτων μείζων ἐστὶν τοῦ $B\Delta \Gamma$ τριγώνου· ὅλη ἄρα ἡ ἐπιφάνεια ἡ μεταξὺ τῶν $A\Delta \Gamma$ μετὰ τῶν εἰρημένων τμημάτων μείζων ἐστὶ τῶν $AB\Delta$, $\Delta B\Gamma$ τριγώνων. ταῦτα δέ ἐστιν ἴσα τῷ $A\Delta\Gamma$ τριγώνῳ καὶ τῷ Θ χωρίῳ· ὧν τὰ εἰρημένα τμήματα ἐλάσσονα τοῦ Θ χωρίου· λοιπὴ ἄρα ἡ ἐπιφάνεια ἡ μεταξὺ τῶν $A\Delta\Gamma$ μείζων ἐστὶν τοῦ $A\Delta\Gamma$ τριγώνου.

ι

Έὰν ἐπιψαύουσαι ἀχθῶσιν τοῦ κύκλου, ὅς ἐστι βάσις τοῦ κώνου, ἐν τῷ αὐτῷ ἐπιπέδῳ οὖσαι τῷ κύκλῳ καὶ συμπίπτουσαι ἀλλήλαις, ἀπὸ δὲ τῶν ἀφῶν καὶ τῆς συμπτώσεως ἐπὶ τὴν κορυφὴν τοῦ κώνου εὐθεῖαι ἀχθῶσιν, τὰ περιεχόμενα τρίγωνα ὑπὸ τῶν ἐπιψαυουσῶν καὶ τῶν ἐπὶ τὴν κορυφὴν τοῦ κώνου ἐπιζευχθεισῶν εὐθειῶν μείζονά ἐστιν τῆς τοῦ κώνου ἐπιφανείας τῆς ἀπολαμβανομένης ὑπ' αὐτῶν. . . .

ιβ΄

... Τούτων δη δεδειγμένων φανερον [ἐπὶ μὲν τῶν προειρημένων],¹ ὅτι, ἐὰν εἰς κῶνον ἰσοσκελη πυραμὶς ἐγγραφη, ἡ ἐπιφάνεια της πυραμίδος χωρὶς της βάσεως ἐλάσσων ἐστὶ της κωνικης ἐπιφανείας [ἕκαστον γὰρ τῶν περιεχόντων τὴν πυραμίδα τριγώνων ἔλασσόν ἐστιν της κωνικης ἐπιφανείας της μεταξὸ τῶν τοῦ τριγώνου πλευρῶν. ὥστε καὶ ὅλη ἡ ἐπιφάνεια της πυραμίδος χωρὶς της 64

greater than the triangle $A\Delta B$. By the same reasoning the surface between $B\Delta$, $\Delta\Gamma$ together with the segments BZ, $Z\Gamma$ is greater than the triangle $B\Delta\Gamma$; therefore the whole surface between $A\Delta$, $\Delta\Gamma$ together with the aforesaid segments is greater than the triangles $AB\Delta$, $\Delta B\Gamma$. Now these are equal to the triangle $A\Delta\Gamma$ and the area Θ ; and the aforesaid segments are less than the area Θ ; therefore the remainder, the surface between $A\Delta$, $\Delta\Gamma$ is greater than the triangle $A\Delta\Gamma$.

Prop. 10

If tangents be drawn to the circle which is the base of an [isosceles] cone, being in the same plane as the circle and meeting one another, and from the points of contact and the point of meeting straight lines be drawn to the vertex of the cone, the triangles formed by the tangents and the lines drawn to the vertex of the cone are together greater than the portion of the surface of the cone included by them. . . . a

Prop. 12

. . . From what has been proved it is clear that, if a pyramid is inscribed in an isosceles cone, the surface of the pyramid without the base is less than the surface of the cone [Prop. 9]. and that, if a pyramid

^a The proof is on lines simil ir to the preceding proposition.

66

is circumscribed about an isosceles cone, the surface of the pyramid without the base is greater than the surface of the cone without the base [Prop. 10].

From what has been demonstrated it is also clear that, if a right prism be inscribed in a cylinder, the surface of the prism composed of the parallelograms is less than the surface of the cylinder excluding the bases a [Prop. 11], and if a right prism be circumscribed about a cylinder, the surface of the prism composed of the parallelograms is greater than the surface of the cylinder excluding the bases.

Prop. 13

The surface of any right cylinder excluding the bases be is equal to a circle whose radius is a mean proportional between the side of the cylinder and the diameter of the

base of the cylinder.

Let the circle A be the base of a right cylinder, let $\Gamma\Delta$ be equal to the diameter of the circle A, let EZ be equal to the side of the cylinder, let H be a mean proportional between $\Delta\Gamma$, EZ, and let there be set out a circle, B, whose radius is equal to H; it is required to prove that the circle B is equal to the surface of the cylinder excluding the bases.

For if it is not equal, it is either greater or less.

^α Here, and in other places in this and the next proposition, Archimedes must have written $\chi \omega \rho i s \tau \hat{\omega} \nu \beta \acute{a} \sigma \epsilon \omega \nu$, not $\chi \omega \rho i s \tau \hat{\eta} s \beta \acute{a} \sigma \epsilon \omega s$.

έλάσσων. ἔστω πρότερον, εί δυνατόν, έλάσσων. δύο δή μεγεθών όντων ανίσων της τε επιφανείας τοῦ κυλίνδρου καὶ τοῦ Β κύκλου δυνατόν έστιν είς τον Β κύκλον ισόπλευρον πολύγωνον έγγράψαι καὶ ἄλλο περιγράψαι, ὥστε τὸ περιγραφὲν πρὸς τὸ ἐγγραφὲν ἐλάσσονα λόγον ἔχειν τοῦ, ὃν ἔχει ή ἐπιφάνεια τοῦ κυλίνδρου πρὸς τὸν Β κύκλον. νοείσθω δή περιγεγραμμένον καὶ έγγεγραμμένον. καὶ περὶ τὸν Α κύκλον περιγεγράφθω εὐθύγραμμον όμοιον τῶ περὶ τὸν Β περιγεγραμμένω, καὶ άνανεγράφθω άπὸ τοῦ εὐθυγράμμου πρίσμα: ἔσται δή περί τον κύλινδρον περιγεγραμμένον. ἔστω δὲ καὶ τῆ περιμέτρω τοῦ εὐθυγράμμου τοῦ περὶ

Gone Ms. has the marginal note, "equalis altitudinis chylindro," on which Heiberg comments: "nec hoc omiserat Archimedes." Heiberg notes several places in which the text is clearly not that written by Archimedes. 68

Let it first be, if possible, less. Now there are two unequal magnitudes, the surface of the cylinder and the circle B, and it is possible to inscribe in the circle B an equilateral polygon, and to circumscribe another, so that the circumscribed has to the inscribed a ratio

less than that which the surface of the cylinder has to the circle B [Prop. 5]. Let the circumscribed and inscribed polygons be imagined, and about the circle A let there be circumscribed a rectilineal figure similar to that circumscribed about B. and on the rectilineal figure let a prism be erected a; it will be circumscribed about the cylinder. Let $K\Delta$ be equal

τὸν Α κύκλον ἴση ἡ ΚΔ καὶ τῆ ΚΔ ἴση ἡ ΛΖ, τῆς δὲ ΓΔ ἡμίσεια ἔστω ἡ ΓΤ΄ ἔσται δὴ τὸ ΚΔΤ τρίγωνον ἴσον τῷ περιγεγραμμένω εὐθυγράμμω περὶ τὸν Α κύκλον [ἐπειδὴ βάσιν μὲν ἔχει τῷ περιμέτρω ἴσην, ὕψος δὲ ἴσον τῷ ἐκ τοῦ κέντρου τοῦ Α κύκλου], τὸ δὲ ΕΛ παραλληλόγραμμον τῷ επιφανεία τοῦ πρίσματος τοῦ περί τὸν κύλινδρον περιγεγραμμένου [έπειδὴ περιέχεται ὑπὸ τῆs πλευρᾶς τοῦ κυλίνδρου καὶ τῆς ἴσης τῆ περιμέτρω τῆς βάσεως τοῦ πρίσματος]. κείσθω δὴ τῆ ΕΖ ἴση ἡ ΕΡ· ἴσον ἄρα ἐστὶν τὸ ΖΡΛ τρίγωνον τῷ ΕΛ παραλληλογράμμω, ώστε καὶ τῆ ἐπιφανεία τοῦ πρίσματος.΄ καὶ ἐπεὶ ὅμοιά ἐστιν τὰ εὐθύγραμμα τὰ περὶ τοὺς Α, Β κύκλους περιγεγραμμένα, τὸν αὐτὸν ἔξει λόγον [τὰ εὐθύγραμμα], ὅνπερ αί έκ των κέντρων δυνάμει έξει άρα το ΚΤΔ τρίγωνον πρός τὸ περὶ τὸν Β κύκλον εὐθύγραμμον λόγον, δν ή $T\Delta$ πρὸς H δυνάμει $[ai \ \gamma \dot{a} \rho \ T\Delta, \ H$ ἴσαι εἰσὶν τα \hat{i} ς εκ των κέντρων]. ἀλλ' δν ἔχει λόγον ή ΤΔ πρὸς Η δυνάμει, τοῦτον έχει τὸν λόγον ή ΤΔ πρὸς ΡΖ μήκει [ή γὰρ Η τῶν ΤΔ, ΡΖ μέση έστὶ ἀνάλογον διὰ τὸ καὶ τῶν ΓΔ, ΕΖ· πῶς δὲ τοῦτο; ἐπεὶ γὰρ ἴση ἐστὶν ἡ μὲν ΔΤ τῆ ΤΓ, ἡ δέ ΡΕ τη ΕΖ, διπλασία ἄρα ἐστὶν ή ΓΔ της ΤΔ, καὶ ή ΡΖ τῆς ΡΕ· ἔστιν ἄρα, ὡς ή ΔΓ πρὸς ΔΤ, οὕτως ἡ PZ πρὸς ZΕ. τὸ ἄρα ὑπὸ τῶν ΓΔ, ΕΖ ἴσον ἐστὶν τῷ ὑπὸ τῶν ΤΔ, PZ. τῷ δὲ ὑπὸ τῶν $\Gamma \Delta$, EZ ἴσον ἐστὶν τὸ ἀπὸ $H \cdot \kappa$ αὶ τῷ ὑπὸ τῶν ΤΔ, ΡΖ ἄρα ἴσον ἐστὶ τὸ ἀπὸ τῆς Η. ἔστιν ἄρα.

 ¹ ἐπειδὴ . . . κύκλου om. Heiberg.
 ² ἐπειδὴ . . . πρίσματος om. Heiberg.
 ³ τὰ εὐθύγραμμα om. Torellius.

to the perimeter of the rectilineal figure about the circle A, let ΛZ be equal to $K\Delta$, and let ΓT be half of $\Gamma \Delta$; then the triangle $K\Delta T$ will be equal to the rectilineal figure circumscribed about the circle A, while the parallelogram $E\Lambda$ will be equal to the surface of the prism circumscribed about the cylinder. Let EP be set out equal to EZ; then the triangle $ZP\Lambda$ is equal to the parallelogram $E\Lambda$ [Eucl. i. 41], and so to the surface of the prism. And since the rectilineal figures circumscribed about the circles A, B are similar, they will stand in the same ratio as the squares on the radii c ; therefore the triangle $KT\Delta$ will have to the rectilineal figure circumscribed about the circle B the ratio $T\Delta^2$: H^2 .

But $T\Delta^2: H^2 = T\Delta: PZ^d$

^a Because the base $K\Delta$ is equal to the perimeter of the polygon, and the altitude ΔT is equal to the radius of the circle A, *i.e.*, to the perpendiculars drawn from the centre of A to the sides of the polygon.

 b Because the base ΛZ is made equal to ΔK and so is equal to the perimeter of the polygon forming the base of the prism, while the altitude EZ is equal to the side of the cylinder and

therefore to the height of the prism.

^c Eutocius supplies a proof based on Eucl. xii. 1, which proves a similar theorem for inscribed figures.

oves a similar discovery.

For, by hypothesis, $H^2 = \Delta \Gamma$. EZ $= 2T \Delta \cdot \frac{1}{2}PZ$ $= T \Delta \cdot PZ$

Heiberg would delete the demonstration in the text on the ground of excessive verbosity, as Nizze had already perceived to be necessary.

ώς ή ΤΔ πρός Η, οὕτως ή Η πρός ΡΖ έστιν ἄρα, ώς ή ΤΔ πρός PZ, τὸ ἀπὸ τῆς ΤΔ πρός τὸ ἀπὸ τῆς Η ἐὰν γὰρ τρεῖς εὐθεῖαι ἀνάλογον ὧσιν, ἔστιν, ώς ή πρώτη πρὸς την τρίτην, τὸ ἀπὸ τῆς πρώτης είδος πρὸς τὸ ἀπὸ τῆς δευτέρας είδος τὸ ὅμοιον καὶ ὁμοίως ἀναγεγραμμένον]. ὁν δὲ λόγον ἔχει ἡ ΤΔ πρὸς ΡΖ μήκει, τοῦτον ἔχει τὸ ΚΤΔ τρίγωνον πρός το ΡΑΖ [έπειδήπερ ίσαι είσιν αι ΚΔ, ΛΖ]. τὸν αὐτὸν ἄρα λόγον ἔχει τὸ ΚΤΔ τρίγωνον πρὸς τὸ εὐθύγραμμον τὸ περί τὸν Β κύκλον περιγεγραμ-μένον, ὅνπερ τὸ ΤΚΔ τρίγωνον πρὸς τὸ ΡΖΛ τρίγωνον. ἴσον ἄρα ἐστὶν τὸ ΖΛΡ τρίγωνον τῷ περί τον Β κύκλον περιγεγραμμένω εὐθυγράμμω. ωστε καὶ ἡ ἐπιφάνεια τοῦ πρίσματος τοῦ περὶ τὸν ${f A}$ κύλινδρον περιγεγραμμένου τ $\hat{m \omega}$ εὐθυγράμμ $m \omega$ τ $\hat{m \omega}$ περὶ τὸν Β κύκλον ἴση ἐστίν. καὶ ἐπεὶ ἐλάσσονα λόγον ἔχει τὸ εὐθύγραμμον τὸ περὶ τὸν Β κύκλον προς το έγγεγραμμένον έν τῷ κύκλῳ τοῦ, ὃν ἔχει ή επιφάνεια τοῦ Α κυλίνδρου πρός τὸν Β κύκλον, έλάσσονα λόγον έξει καὶ ἡ ἐπιφάνεια τοῦ πρίσματος τοῦ περὶ τὸν κύλινδρον περιγεγραμμένου πρὸς τὸ εὐθύγραμμον τὸ ἐν τῷ κύκλῳ τῷ Β ἐγγεγραμμένον ηπερ ή επιφάνεια τοῦ κυλίνδρου πρός τον Β κύκλον. καὶ ἐναλλάξ· ὅπερ ἀδύνατον [ἡ μὲν γὰρ ἐπιφάνεια τοῦ πρίσματος τοῦ περιγεγραμμένου περὶ τον κύλινδρον μείζων οῦσα δέδεικται τῆς ἐπιφανείας τοῦ κυλίνδρου, τὸ δὲ ἐγγεγραμμένον εὐθύγραμμον έν τῷ Β κύκλω ἔλασσόν ἐστιν τοῦ Β κύκλου].3 οὐκ ἄρα ἐστὶν ὁ Β κύκλος ἐλάσσων τῆς ἐπιφανείας τοῦ κυλίνδρου.

¹ ή γὸρ . . . όμοίως ἀναγεγραμμένον om. Heiberg. 2 ἐπειδήπερ . . . ΚΔ, ΛΖ om. Heiberg.

 $T\Delta$: PZ = triangle $KT\Delta$: triangle PAZ.

Therefore the ratio which the triangle KT∆ has to the rectilineal figure circumscribed about the circle B is the same as the ratio of the triangle TKA to the triangle PZA. Therefore the triangle $TK\Delta$ is equal to the rectilineal figure circumscribed about the circle B [Eucl. v. 9]; and so the surface of the prism circumscribed about the cylinder A is equal to the rectilineal figure about B. And since the rectilineal figure about the circle B has to the inscribed figure in the circle a ratio less than that which the surface of the cylinder A has to the circle B [ex hypothesi], the surface of the prism circumscribed about the cylinder will have to the rectilineal figure inscribed in the circle B a ratio less than that which the surface of the cylinder has to the circle B; and, permutando, [the prism will have to the cylinder a ratio less than that which the rectilineal figure inscribed in the circle B has to the circle B] b; which is absurd.^c Therefore the circle B is not less than the surface of the cylinder.

^a By Eucl. vi. 1, since $\Lambda Z = K\Delta$.

 b From Eutocius's comment it appears that Archimedes wrote, in place of καὶ ἐναλλάξ· ὅπερ ἀδύνατον in our text: ἐναλλάξ ὅρα ἐλάσσονα λόγον ἔχει τὸ πρίσμα πρὸς τὸν κύλινδρον ἤπερ τὸ ἐγγεγραμμένον εἰς τὸν $^{\rm E}$ κύκλον πολύγωνον πρὸς τὸν $^{\rm E}$ κύκλον τολύγωνον πρὸς τὸν $^{\rm E}$ κύκλον τολύγωνον $^{\rm E}$ τον $^{\rm E}$ κύκλον $^{\rm E}$ κύκλον $^{\rm E}$ τον $^{\rm E}$ $^{\rm E}$ τον $^{\rm E}$ το

^c For the surface of the prism is greater than the surface of the cylinder [Prop. 12], but the inscribed figure is less than the circle B; the explanation in our text to this effect is shown to be an interpolation by the fact that Eutocius sup-

plies a proof in his own words.

³ ή μέν . . . τοῦ Β κύκλου om. Heiberg ex Eutocio.

¹ διότι . . . καθέτου om. Heiberg.

^a For the base $K\Delta$ is equal to the perimeter of the polygon and the altitude ΔT , which is equal to the radius of the 74.

Now let it be, if possible, greater. Again, let there be imagined a rectilineal figure inscribed in the circle B, and another circumscribed, so that the circumscribed figure has to the inscribed a ratio less than that which the circle B has to the surface of the cylinder [Prop. 5], and let there be inscribed in the circle A a polygon similar to the figure inscribed in the circle B, and let a prism be erected on the polygon inscribed in the circle [A]; and again let $K\Delta$ be equal to the perimeter of the rectilineal figure inscribed in the circle A, and let $Z\Lambda$ be equal to it. Then the triangle KTA will be greater than the rectilineal figure inscribed in the circle A.a and the parallelogram EA will be equal to the surface of the prism composed of the parallelograms b; and so the triangle PAZ is equal to the surface of the prism. And since the rectilineal figures inscribed in the circles A, B are similar, they have the same ratio one to the other as the squares of their radii [Eucl. xii. 1]. But the triangles KTA, ZPA have one to the other the same ratio as the squares of the radii c; therefore the rectilineal figure inscribed in

circle A, is greater than the perpendiculars drawn from the centre of the circle to the sides of the polygon; but Heiberg regards the explanation to this effect in the text as an interpolation.

^b Because the base $Z\Lambda$ is made equal to $K\Delta$, and so is equal to the perimeter of the polygon forming the base of the prism, while the altitude EZ is equal to the side of the cylinder and therefore to the height of the prism.

^c For triangle $KT\Delta$: triangle $ZPA = T\Delta$: ZP

 $=T\Delta^2:H^2$

[cf. p. 71 n. d.

But $T\Delta$ is equal to the radius of the circle A, and H to the radius of the circle B.

¹ ἐπεὶ . . . πρίσματος om. Heiberg.

^a For since the figure circumscribed about the circle B has to the inscribed figure a ratio less than that which the circle B has to the surface of the cylinder [ex hypothesi], and the circle B is less than the circumscribed figure, therefore the 76

the circle A has to the rectilineal figure inscribed in the circle B the same ratio as the triangle $KT\Delta$ has to the triangle ΛZP . But the rectilineal figure inscribed in the circle A is less than the triangle $KT\Delta$; therefore the rectilineal figure inscribed in the circle B is less than the triangle ZPA; and so it is less than the surface of the prism inscribed in the cylinder; which is impossible. Therefore the circle B is not greater than the surface of the cylinder. But it was proved not to be less. Therefore it is equal.

Prop. 14

The surface of any cone nithout the base is equal to a circle, whose radius is a mean proportional between the side of the cone and the radius of the circle which is the base of the cone.

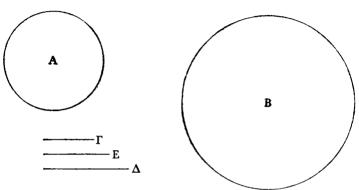

Let there be an isosceles cone, whose base is the circle A, and let its radius be Γ , and let Δ be equal

inscribed figure is greater than the surface of the cylinder, and a fortiori is greater than the surface of the prism [Prop. 12]. An explanation on these lines is found in our text, but as the corresponding proof in the first half of the proposition was unknown to Eutocius, this also must be presumed an interpolation.

κώνου ἔστω ἴση ἡ Δ, τῶν δὲ Γ, Δ μέση ἀνάλογον ἡ Ε, ὁ δὲ Β κύκλος ἐχέτω τὴν ἐκ τοῦ κέντρου τῆ Ε ἴσην· λέγω, ὅτι ὁ Β κύκλος ἐστὶν ἴσος τῆ ἐπιφανεία τοῦ κώνου χωρὶς τῆς βάσεως.

Εί γὰρ μή ἐστιν ἴσος, ήτοι μείζων ἐστὶν ἢ έλάσσων. ἔστω πρότερον έλάσσων. ἔστι δη δύο μεγέθη ἄνισα ή τε ἐπιφάνεια τοῦ κώνου καὶ ὁ Β κύκλος, καὶ μείζων ή ἐπιφάνεια τοῦ κώνου δυνατον άρα είς τον Β κύκλον πολύγωνον ἰσόπλευρον έγγράψαι καὶ ἄλλο περιγράψαι ὅμοιον τῷ έγγεγραμμένω, ώστε τὸ περιγεγραμμένον πρὸς τὸ έγγεγραμμένον ελάσσονα λόγον έχειν τοῦ, ὃν έχει ή επιφάνεια τοῦ κώνου πρὸς τὸν Β κύκλον. νοείσθω δη καὶ περὶ τὸν Α κύκλον πολύγωνον περιγεγραμμένον δμοιον τῷ περὶ τὸν Β κύκλον περιγεγραμμένω, καὶ ἀπὸ τοῦ περὶ τὸν Α κύκλον περιγεγραμμένου πολυγώνου πυραμίς ανεστάτω αναγεγραμμένη την αὐτην κορυφην έχουσα τω κώνω. ἐπεὶ οὖν ὅμοιά ἐστιν τὰ πολύγωνα τὰ πεοὶ 78

to the side of the cone, and let E be a mean proportional between Γ , Δ , and let the circle B have its

radius equal to E; I say that the circle B is equal to the surface of the cone without the base.

For if it is not equal, it is either greater or less. First let it be less. Then there are two unequal magnitudes, the surface of the cone and the circle B, and the surface of the cone is the greater; it is therefore possible to inscribe an equilateral polygon in the circle B and to circumscribe another similar to the inscribed polygon, so that the circumscribed polygon has to the inscribed polygon a ratio less than that which the surface of the cone has to the circle B [Prop. 5]. Let this be imagined, and about the circle A let a polygon circumscribed about the circle B, and on the polygon circumscribed about the circle A let a pyramid be raised having the same vertex as the cone. Now since the polygons circumscribed about

τους Α, Β κύκλους περιγεγραμμένα, τον αὐτον ἔχει λόγον πρὸς ἄλληλα, ον αί ἐκ τοῦ κέντρου δυνάμει προς άλλήλας, τουτέστιν ον έχει ή Γ προς Ε δύναμει, τουτέστιν ή Γ πρός Δ μήκει. ον δέ λόγον ἔχει ἡ Γ πρὸς Δ μήκει, τοῦτον ἔχει τὸ περιγεγραμμένον πολύγωνον περί τον Α κύκλον πρός την επιφάνειαν της πυραμίδος της περιγεγραμμένης περί τὸν κῶνον [ἡ μὲν γὰρ Γ ἴση έστὶ τῆ ἀπὸ τοῦ κέντρου καθέτω ἐπὶ μίαν πλευράν τοῦ πολυγώνου, ή δὲ Δ τῆ πλευρᾶ τοῦ κώνου. κοινον δε ύψος ή περίμετρος τοῦ πολυγώνου προς τὰ ἡμίση τῶν ἐπιφανειῶν] τὸν αὐτὸν ἄρα λόγον έχει τὸ εὐθύγραμμον τὸ περὶ τὸν Α κύκλον πρὸς τὸ εὐθύγραμμον τὸ περὶ τὸν Β κύκλον καὶ αὐτὸ τὸ εὐθύγραμμον πρὸς τὴν ἐπιφάνειαν τῆς πυραμίδος της περιγεγραμμένης περί τον κώνον ώστε ίση έστιν ή επιφάνεια της πυραμίδος τω εὐθυγράμμω τῶ περὶ τὸν Β κύκλον περιγεγραμμένω. ἐπεὶ οὖν έλάσσονα λόγον έχει τὸ εὐθύγραμμον τὸ περὶ τὸν Β κύκλον περιγεγραμμένον πρός το έγγεγραμμένον ήπερ ή επιφάνεια τοῦ κώνου πρὸς τὸν Β κύκλον, ελάσσονα λόγον έξει ή επιφάνεια τη; πυραμίδος της περί τὸν κῶνον περιγεγραμμένης πρὸς τὸ εὐθύγραμμον τὸ ἐν τῷ Β κύκλω ἐγγεγραμμένον ήπερ ή ἐπιφάνεια τοῦ κώνου πρὸς τὸν Β κύκλον· όπερ ἀδύνατον [ή μὲν γὰρ ἐπιφάνεια τῆς πυραμίδος μείζων οὖσα δέδεικται τῆς ἐπιφανείας τοῦ κώνου, τὸ δὲ ἐγγεγραμμένον εὐθύγραμμον ἐν τῷ Β κύκλω έλασσον έσται τοῦ Β κύκλου. οὐκ ἄρα ὁ Β κύκλος ελάσσων έσται της επιφανείας τοῦ κώνου.

the circles A, B are similar, they have the same ratio one toward the other as the square of the radii have one toward the other, that is $\hat{\Gamma}^2 : E^2$, or $\Gamma : \Delta$ [Eucl. vi. 20, coroll. 2]. But Γ : Δ is the same ratio as that of the polygon circumscribed about the circle A to the surface of the pyramid circumscribed about the cone a; therefore the rectilineal figure about the circle A has to the rectilineal figure about the circle B the same ratio as this rectilineal figure [about A] has to the surface of the pyramid circumscribed about the cone; therefore the surface of the pyramid is equal to the rectilineal figure circumscribed about the circle B. Since the rectilineal figure circumscribed about the circle B has towards the inscribed [rectilineal figure a ratio less than that which the surface of the cone has to the circle B, therefore the surface of the pyramid circumscribed about the cone will have to the rectilineal figure inscribed in the circle B a ratio less than that which the surface of the cone has to the circle B; which is impossible.^b Therefore the circle B will not be less than the surface of the cone.

^a For the circumscribed polygon is equal to a triangle, whose base is equal to the perimeter of the polygon and whose height is equal to Γ , while the surface of the pyramid is equal to a triangle having the same base and height Δ [Prop. 8]. There is an explanation to this effect in the Greek, but so obscurely worded that Heiberg attributes it to an interpolator.

^b For the surface of the pyramid is greater than the surface of the cone [Prop. 12], while the inscribed polygon is less

than the circle B.

Λέγω δή, ὅτι οὐδὲ μείζων. εἰ γὰρ δυνατόν έστιν, έστω μείζων. πάλιν δή νοείσθω είς τὸν Β κύκλον πολύγωνον έγγεγραμμένον καὶ ἄλλο περιγεγραμμένον, ώστε τὸ περιγεγραμμένον πρὸς τὸ έγγεγραμμένον έλάσσονα λόγον ἔχειν τοῦ, ὃν ἔχει ό Β κύκλος πρός την ἐπιφάνειαν τοῦ κώνου, καὶ είς τὸν Α κύκλον νοείσθω έγγεγραμμένον πολύγωνον όμοιον τῷ εἰς τὸν Β κύκλον εγγεγραμμένω, καὶ ἀναγεγράφθω ἀπ' αὐτοῦ πυραμίς τὴν αὐτὴν κορυφην έχουσα τῶ κώνω. ἐπεὶ οὖν ὅμοιά ἐστι τὰ ἐν τοῖς Α, Β κύκλοις ἐγγεγραμμένα, τὸν αὐτὸν έξει λόγον πρὸς ἄλληλα, δυ αί ἐκ τῶν κέντρων δυνάμει πρός αλλήλας τον αὐτον άρα λόγον ἔχει τὸ πολύνωνον πρὸς τὸ πολύνωνον καὶ ἡ Γ πρὸς την Δ μήκει. ή δε Γ προς την Δ μείζονα λόγον έχει ή τὸ πολύγωνον τὸ ἐν τῷ Α κύκλω ἐγγεγραμμένον πρός την επιφάνειαν της πυραμίδος της έγγεγραμμένης είς τὸν κῶνον [ή γὰρ ἐκ τοῦ κέντρου τοῦ Α κύκλου πρὸς τὴν πλευρὰν τοῦ κώνου μείζονα λόγον έχει ήπερ ή ἀπὸ τοῦ κέντρου ἀγομένη κάθετος ἐπὶ μίαν πλευράν τοῦ πολυγώνου πρός την έπὶ την πλευράν τοῦ πολυγώνου κάθετον άγομένην ἀπὸ τῆς κορυφῆς τοῦ κώνου] · μεί-

¹ ή γάρ . . . τοῦ κώνου om. Heiberg.

^a Eutocius supplies a proof. ZOK is the polygon inscribed in the circle A (of centre A), AH is drawn perpendicular to 82

I say now that neither will it be greater. For if it is possible, let it be greater. Then again let there be imagined a polygon inscribed in the circle B and another circumscribed, so that the circumscribed has to the inscribed a ratio less than that which the circle B has to the surface of the cone [Prop. 5], and in the circle A let there be imagined an inscribed polygon similar to that inscribed in the circle B, and on it let there be drawn a pyramid having the same vertex as the cone. Since the polygons inscribed in the circles A. B are similar, therefore they will have one toward the other the same ratio as the squares of the radii have one toward the other; therefore the one polygon has to the other polygon the same ratio as Γ to Δ [Eucl. vi. 20, coroll. 2]. But Γ has to Δ a ratio greater than that which the polygon inscribed in the circle A has to the surface of the pyramid inscribed in the cone a; therefore the polygon in-

 $K\Theta$ and meets the circle in M, A is the vertex of the isosceles cone (so that ΛH is perpendicular to $K\Theta$), and HN is drawn parallel to MA to meet ΛA in N. Then the area of the polygon in-cribed in the circle=1 perimeter of polygon. AH, and the area of the pyramid inscribed in the cone=1 perimeter of poly gon . AH, so that the area of the polygon has to the area of the pyramid the ratio AH: AH. Now. by similar triangles, $AM : M\Lambda =$ AH : HN, and AH : HN > AH : HA. for HA>HN. Therefore AM: MA. >AII: HA; that is, $\Gamma:\Delta$ exceeds the ratio of the polygon to the surface of the pyramid.

ζονα ἄρα λόγον ἔχει τὸ πολύγωνον τὸ ἐν τῷ Α κύκλω έγγεγραμμένον πρός τό πολύγωνον τὸ έν τω Β έγγεγραμμένον η αὐτὸ τὸ πολύγωνον πρὸς την επιφάνειαν της πυραμίδος μείζων ἄρα εστίν ή επιφάνεια της πυραμίδος τοῦ εν τῷ Β πολυγώνου εγγεγραμμένου. ελάσσονα δε λόγον έχει τὸ πολύγωνον το περί τον Β κύκλον περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον ἢ ὁ Β κύκλος πρὸς τὴν ἐπιφάνειαν τοῦ κώνου πολλῷ ἄρα τὸ πολύγωνον τὸ περὶ τὸν Β κύκλον περιγεγραμμένον πρὸς τὴν ἐπιφάνειαν τῆς πυραμίδος τῆς ἐν τῷ κώνω ἐγγεγραμμένης ελάσσονα λόγον έχει η δ Β κύκλος προς την επιφάνειαν τοῦ κώνου ὅπερ ἀδύνατον [τὸ μὲν γὰρ περιγεγραμμένον πολύγωνον μεῖζόν εστιν τοῦ Β κύκλου, ἡ δὲ ἐπιφάνεια τῆς πυραμίδος της εν τῷ κώνω ελάσσων εστὶ της επιφανείας τοῦ κώνου]. οὐκ ἄρα οὐδὲ μείζων ἐστὶν ὁ κύκλος τῆς **ἐ**πιφανείας τοῦ κώνου. ἐδείχθη δέ, ὅτι οὐδὲ έλάσσων ισος άρα.

K

Έὰν κῶνος ἰσοσκελης ἐπιπέδῳ τμηθη παραλλήλω τῆ βάσει, τῆ μεταξὺ τῶν παραλλήλων ἐπιπέδων ἐπιφανεία τοῦ κώνου ἴσος ἐστὶ κύκλος, οὖ ἡ ἐκ τοῦ κέντρου μέσον λόγον ἔχει τῆς τε πλευρᾶς τοῦ κώνου τῆς μεταξὺ τῶν παραλλήλων ἐπιπέδων καὶ τῆς ἴσης ἀμφοτέραις ταῖς ἐκ τῶν κέντρων τῶν κύκλων τῶν ἐν τοῖς παραλλήλοις ἐπιπέδοις.

Έστω κῶνος, οὖ το διὰ τοῦ ἄξονος τρίγωνον ἴσον τῷ ΑΒΓ, καὶ τετμήσθω παραλλήλω ἐπιπέδω τῆ βάσει, καὶ ποιείτω τομὴν τὴν ΔΕ, ἄξων δὲ τοῦ κώνου ἔστω ὁ ΒΗ κύκλος δέ τις ἐκκείσθω, οὖ ἡ

scribed in the circle A has to the polygon inscribed in the circle B a ratio greater than that which the same polygon [inscribed in the circle A] has to the surface of the pyramid: therefore the surface of the pyramid is greater than the polygon inscribed in B. Now the polygon circumscribed about the circle B has to the inscribed polygon a ratio less than that which the circle B has to the surface of the cone; by much more therefore the polygon circumscribed about the circle B has to the surface of the pyramid inscribed in the cone a ratio less than that which the circle B has to the surface of the pyramid inscribed in the cone a ratio less than that which the circle B has to the surface of the cone; which is impossible. Therefore the circle is not greater than the surface of the cone. And it was proved not to be less; therefore it is equal.

Prop. 16

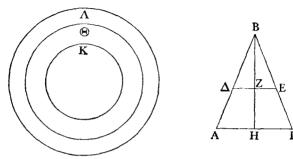

If an isosceles cone be cut by a plane parallel to the base, the portion of the surface of the cone between the parallel planes is equal to a circle whose radius is a mean proportional between the portion of the side of the cone between the parallel planes and a straight line equal to the sum of the radii of the circles in the parallel planes.

Let there be a cone, in which the triangle through the axis is equal to $AB\Gamma$, and let it be cut by a plane parallel to the base, and let [the cutting plane] make the section ΔE , and let BH be the axis of the cone,

^a For the circumscribed polygon is greater than the circle B, but the surface of the inscribed pyramid is less than the surface of the cone [Prop. 12]; the explanation to this effect in the text is attributed by Heiberg to an interpolator.

¹ τὸ μὲν . . . τοῦ κώνου om. Heiberg.

ἐκ τοῦ κέντρου μέση ἀνάλογόν ἐστι τῆς τε $A\Delta$ καὶ συναμφοτέρου τῆς ΔZ , HA, ἔστω δὲ κύκλος ὁ Θ

λέγω, ὅτι ὁ Θ κύκλος ἴσος ἐστὶ τῆ ἐπιφανεία τοῦ

κώνου τῆ μεταξύ τῶν ΔΕ, ΑΓ.

'Εκκείσθωσαν γὰρ κύκλοι οἱ Λ, Κ, καὶ τοῦ μὲν Κ κύκλου ἡ ἐκ τοῦ κέντρου δυνάσθω τὸ ὑπὸ ΒΔΖ, τοῦ δὲ Λ ἡ ἐκ τοῦ κέντρου δυνάσθω τὸ ὑπὸ ΒΑΗ· ὁ μὲν ἄρα Λ κύκλος ἴσος ἐστὶν τῆ ἐπιφανεία τοῦ ΑΒΓ κώνου, ὁ δὲ Κ κύκλος ἴσος ἐστὶν τῆ ἐπιφανεία τοῦ ΔΕΒ. καὶ ἐπεὶ τὸ ὑπὸ τῶν ΒΑ, ΑΗ ἴσον ἐστὶ τῷ τε ὑπὸ τῶν ΒΔ, ΔΖ καὶ τῷ ὑπὸ τῆς ΑΔ καὶ συναμφοτέρου τῆς ΔΖ, ΑΗ διὰ τὸ παράλληλον εἶναι τὴν ΔΖ τῆ ΑΗ, ἀλλὰ τὸ μὲν ὑπὸ ΑΒ, ΑΗ δύναται ἡ ἐκ τοῦ κέντρου τοῦ Λ κύκλου, τὸ δὲ ὑπὸ ΒΔ, ΔΖ δύναται ἡ ἐκ τοῦ κέντρου τοῦ Κ κύκλου, τὸ δὲ ὑπὸ τῆς ΔΑ καὶ συναμφοτέρου τῆς ΔΖ, ΑΗ δύναται ἡ ἐκ τοῦ κέντρου τοῦ Θ, τὸ ἄρα ἀπὸ τῆς ἐκ τοῦ κέντρου τοῦ Λ κύκλου ἴσον ἐστὶ τοῖς ἀπὸ τῶν ἐκ τῶν κέντρων τῶν Κ, Θ κύκλων· ὥστε καὶ ὁ Λ κύκλος ἵσος ἐστὶ τοῖς Κ, Θ κύκλοις. 86

and let there be set out a circle whose radius is a mean proportional between $A\Delta$ and the sum of ΔZ , HA, and let θ be the circle; I say that the circle θ is equal to the portion of the surface of the cone between ΔE . A Γ .

For let the circles Λ , K be set out, and let the square of the radius of K be equal to the rectangle contained by $B\Delta$, ΔZ , and let the square of the radius of Λ be equal to the rectangle contained by BA, AH; therefore the circle Λ is equal to the surface of the cone $AB\Gamma$, while the circle K is equal to the surface of the cone ΔEB [Prop. 14]. And since

BA . AH = B
$$\Delta$$
 . Δ Z + A Δ . (Δ Z + AH)

because ΔZ is parallel to AH, a while the square of the radius of Λ is equal to AB. AH, the square of the radius of K is equal to $B\Delta \cdot \Delta Z$, and the square of the radius of Θ is equal to $\Delta A \cdot (\Delta Z + AH)$, therefore the square on the radius of the circle Λ is equal to the sum of the squares on the radii of the circles K, Θ ; so that the circle Λ is equal to the sum of the circles

^a The proof is given by Eutocius as follows:

 $B\Lambda : AII = B\Delta : \Delta Z$

 $B\Lambda \cdot \Delta Z = B\Delta \cdot AH$.

[Eucl. vi. 16 [Eucl. ii. 1

 $\therefore B\Delta \cdot AH = B\Delta \cdot \Delta Z + A\Delta \cdot \Delta Z.$

Let $\Delta A \cdot AH$ be added to both sides.

 $BA \cdot \Delta Z = B\Delta \cdot \Delta Z + A\Delta \cdot \Delta Z$.

Then $B\Delta \cdot AH + \Delta A + AH$,

٠.

But

i.e. $BA \cdot AH = B\Delta \cdot \Delta Z + A\Delta \cdot \Delta Z + A\Delta \cdot AH$.

άλλ' ὁ μèν Λ ἴσος ἐστὶ τῆ ἐπιφανεία τοῦ $BA\Gamma$ κώνου, ὁ δὲ K τῆ ἐπιφανεία τοῦ ΔBE κώνου λοιπὴ ἄρα ἡ ἐπιφάνεια τοῦ κώνου ἡ μεταξὺ τῶν παραλλήλων ἐπιπέδων τῶν ΔE , $A\Gamma$ ἴση ἐστὶ τῷ Θ κύκλῳ.

κα'

'Èàν εἰς κύκλον πολύγωνον ἐγγραφῆ ἀρτιοπλευρόν τε καὶ ἰσόπλευρον, καὶ διαχθῶσιν εὐθεῖαι ἐπιζευγνύουσαι τὰς πλευρὰς τοῦ πολυγώνου, ὥστε αὐτὰς παραλλήλους εἶναι μιῷ ὁποιᾳοῦν τῶν ὑπὸ δύο πλευρὰς τοῦ πολυγώνου ὑποτεινουσῶν, αἱ ἐπιζευγνύουσαι πᾶσαι πρὸς τὴν τοῦ κύκλου διάμετρον τοῦτον ἔχουσι τὸν λόγον, ὃν ἔχει ἡ ὑποτείνουσα τὰς μιῷ ἐλάσσονας τῶν ἡμίσεων πρὸς τὴν πλευρὰν τοῦ πολυγώνου.

"Εστω κύκλος δ ΑΒΓΔ, καὶ ἐν αὐτῷ πολύγωνον ἐγγεγράφθω τὸ ΑΕΖΒΗΘΓΜΝΔΛΚ, καὶ ἐπεζεύχθωσαν αἱ ΕΚ, ΖΛ, ΒΔ, ΗΝ, ΘΜ· δῆλον δή, ὅτι παράλληλοί εἰσιν τῆ ὑπὸ δύο πλευρὰς τοῦ πολυγώνου ὑποτεινούση λέγω οὖν, ὅτι αἱ εἰρημέναι πᾶσαι πρὸς τὴν τοῦ κύκλου διάμετρον τὴν ΑΓ τὸν

αὐτὸν λόγον ἔχουσι τῷ τῆς ΓΕ πρὸς ΕΑ.

¹ καὶ ἐπεὶ . . . EK, AO om. Heiberg.

K. θ . But Λ is equal to the surface of the cone BA Γ , while K is equal to the surface of the cone ΔBE ; therefore the remainder, the portion of the surface of the cone between the parallel planes ΔE , A Γ , is equal to the circle θ .

Prop. 21

If a regular polygon with an even number of sides be inscribed in a circle, and straight lines be drawn joining the angles a of the polygon, in such a manner as to be parallel to any one whatsoever of the lines subtended by two sides of the polygon, the sum of these connecting lines bears to the diameter of the circle the same ratio as the straight line subtended by half the sides less one bears to the side of the polygon.

Let $AB\Gamma\Delta$ be a circle, and in it let the polygon $AEZBH\Theta\Gamma MN\Delta\Lambda K$ be inscribed, and let $EK,Z\Lambda,B\Delta,HN,\Theta M$ be joined; then it is clear that they are parallel to a straight line subtended by two sides of the polygon b; I say therefore that the sum of the aforementioned straight lines bears to $A\Gamma$, the diameter of the circle, the same ratio as ΓE bears to EA.

For let ZK, ΛB , $H\Delta$, ΘN be joined; then ZK is parallel to EA, $B\Lambda$ to ZK, also ΔH to $B\Lambda$, ΘN to ΔH and ΓM to ΘN ; therefore

 $E\Xi : \Xi A = K\Xi : \Xi O.$

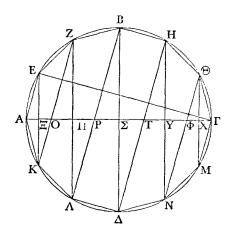

But $K\Xi : \Xi O = Z\Pi : \Pi O$, [Eucl. vi. 4]

° For, as the arcs AK, EZ are equal, ∠AEK=∠EKZ, and therefore AE is parallel to ZK; and so on.

a "Sides" according to the text, but Heiberg thinks Archimedes probably wrote γωνίας where we have πλευράς.

^b For, because the arcs KA, EZ are equal, $\angle EKZ = \angle KZA$ [Eucl. iii. 27]; therefore EK is parallel to AZ; and so on.

 $\dot{\eta}$ ZΠ πρὸς ΠΟ, $\dot{\eta}$ ΛΠ πρὸς ΠΡ, $\dot{\omega}$ ς δὲ $\dot{\eta}$ ΛΠ πρὸς ΠΡ, οὕτως $\dot{\eta}$ ΒΣ πρὸς ΣΡ, καὶ ἔτι, $\dot{\omega}$ ς $\dot{\eta}$ μὲν ΒΣ πρὸς ΣΡ, $\dot{\eta}$ ΔΣ πρὸς ΣΤ, $\dot{\omega}$ ς δὲ $\dot{\eta}$ ΔΣ πρὸς ΣΤ, $\dot{\eta}$ ΗΥ πρὸς ΥΤ, καὶ ἔτι, $\dot{\omega}$ ς $\dot{\eta}$ μὲν ΗΥ

while	$\Delta \Sigma : \Sigma T = H \Upsilon : \Upsilon T.$	[ibid.
Again,	$HY:YT=NY:Y\Phi,$	[ibid.
while	$XY : Y\Phi = \Theta X : X\Phi$.	[ibid.
Again,	$\Theta X: X\Phi = MX: X\Gamma,$	[ibid.
therefore	$\cdot \mathbf{E}\Xi : \Xi \mathbf{A} = \mathbf{E}\mathbf{K} + \mathbf{Z}\mathbf{\Lambda} + \mathbf{B}\mathbf{\Delta} + \mathbf{H}\mathbf{N}$	+
	$\Theta M : A\Gamma^a$ [Eucl	. v. 12
But	$E\Xi : \Xi A = I'E : EA ;$ [Euc	l. vi. 4
therefore	$\Gamma E : EA = EK + Z\Lambda + B\Delta + HN$	T +

^a By adding all the antecedents and consequents, for

$$\mathbf{E}\mathbf{\Xi}:\mathbf{\Xi}\mathbf{A} = \mathbf{E}\mathbf{\Xi} + \mathbf{K}\mathbf{\Xi} + \mathbf{Z}\mathbf{H} + \mathbf{A}\mathbf{H} + \mathbf{B}\mathbf{\Sigma} + \mathbf{\Delta}\mathbf{\Sigma} + \mathbf{H}\mathbf{Y} + \mathbf{N}\mathbf{Y} + \mathbf{\Theta}\mathbf{X} + \mathbf{M}\mathbf{X}: \mathbf{\Xi}\mathbf{A} + \mathbf{\Xi}\mathbf{O} + \mathbf{H}\mathbf{O} + \mathbf{H}\mathbf{P} + \mathbf{\Sigma}\mathbf{P} + \mathbf{\Sigma}\mathbf{T} + \mathbf{Y}\mathbf{T} + \mathbf{Y}\mathbf{\Phi} + \mathbf{X}\mathbf{O} + \mathbf{X}\mathbf{I}$$

$$= \mathbf{E}\mathbf{K} + \mathbf{Z}\mathbf{A} + \mathbf{B}\mathbf{A} + \mathbf{H}\mathbf{N} + \mathbf{\Theta}\mathbf{M}: \mathbf{A}\mathbf{I}.$$

b If the polygon has 4n sides, then

$$\begin{split} & \angle \text{EFK} = \frac{\pi}{2n} \quad \text{and} \quad \text{EK}: \text{A}\Gamma = \sin\frac{\pi}{2n}, \\ & \angle \text{Z}\Gamma \text{A} = \frac{2\pi}{2n} \quad \text{and} \quad \text{ZA}: \text{A}\Gamma = \sin\frac{2\pi}{2n}, \\ & \angle \Theta \Gamma \text{M} = (2n-1)\frac{\pi}{2n} \text{ and } \Theta \text{M}: \text{A}\Gamma = \sin(2n-1)\frac{\pi}{2n}. \end{split}$$

 $\Theta M : A \Gamma b$

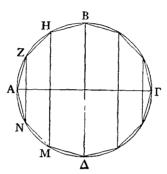

Further, $\angle A\Gamma E = \frac{\pi}{4n}$ and $\Gamma E : EA = \cot \frac{\pi}{4n}$.

Therefore the proposition shows that

$$\sin\frac{\pi}{2n} + \sin\frac{2\pi}{2n} + \dots + \sin\left(2n-1\right)\frac{\pi}{2n} = \cot\frac{\pi}{4n}.$$

Prop. 23

Let AB $\Gamma\Delta$ be the greatest circle in a sphere, and let there be inscribed in it an equilateral polygon, the number of whose sides is divisible by four, and let A Γ , ΔB be diameters. If the diameter A Γ remain stationary and the circle $AB\Gamma\Delta$ containing the polygon be rotated, it is clear that the circumference of the circle will traverse the surface of the sphere, while the angles of the polygon, except those at the points A, Γ , will traverse the circumferences of circles described on the surface of the sphere at right angles to the circle AB $\Gamma\Delta$; their diameters will be the [straight lines] joining the angles of the polygon, being parallel to $B\Delta$. Now the sides of the polygon will traverse certain cones; AZ, AN will traverse the surface of a cone whose base is the circle about the diameter ZN and whose vertex is the point A; ZH,

ΖΗ, ΜΝ κατά τινος κωνικης ἐπιφανείας οἰσθήσονται, ής βάσις μὲν ὁ κύκλος ὁ περὶ διάμετρον τὴν ΜΗ, κορυφὴ δὲ τὸ σημεῖον, καθ' ὁ συμβάλλουσιν ἐκβαλλόμεναι αἱ ΖΗ, ΜΝ ἀλλήλαις τε καὶ τῆ ΑΓ, αἱ δὲ ΒΗ, ΜΔ πλευραὶ κατὰ κωνικης ἐπιφανείας οἰσθήσονται, ής βάσις μέν ἐστιν ὁ κύκλος ὁ περὶ διάμετρον τὴν ΒΔ ὀρθὸς πρὸς τὸν ΑΒΓΔ κύκλον, κορυφὴ δὲ τὸ σημεῖον, καθ' ὁ συμβάλλουσιν ἐκβαλλόμεναι αἱ ΒΗ, ΔΜ ἀλλήλαις τε καὶ τῆ ΓΑ· ὁμοίως δὲ καὶ αἱ ἐν τῷ ἐτέρῳ ἡμικυκλίῳ πλευραὶ κατὰ κωνικῶν ἐπιφανειῶν οἰσθήσονται πάλιν ὁμοίων ταύταις. ἔσται δή τι σχῆμα ἐγγεγραμμένον ἐν τῆ σφαίρα ὑπὸ κωνικῶν ἐπιφανειῶν περιεχόμενον τῶν προειρημένων, οὖ ἡ ἐπιφάνεια ἐλάσσων ἔσται τῆς ἐπιφανείας τῆς σφαίρας.

Διαιρεθείσης γὰρ τῆς σφαίρας ὑπὸ τοῦ ἐπιπέδου τοῦ κατὰ τὴν ΒΔ ὀρθοῦ πρὸς τὸν ΑΒΓΔ κύκλον ἡ ἐπιφάνεια τοῦ ἐτέρου ἡμισφαιρίου καὶ ἡ ἐπιφάνεια τοῦ οχήματος τοῦ ἐν αὐτῷ ἐγγεγραμμένου τὰ αὐτὰ πέρατα ἔχουσιν ἐν ἐνὶ ἐπιπέδῳ· ἀμφοτέρων γὰρ τῶν ἐπιφανειῶν πέρας ἐστὶν τοῦ κύκλου ἡ περιφέρεια τοῦ περὶ διάμετρον τὴν ΒΔ ὀρθοῦ πρὸς τὸν ΑΒΓΔ κύκλον· καί εἰσιν ἀμφότεραι ἐπὶ τὰ αὐτὰ κοῖλαι, καὶ περιλαμβάνεται αὐτῶν ἡ ἐτέρα ὑπὸ τῆς ἐπέρας ἐπιφανείας καὶ τῆς ἐπιπέδου τῆς τὰ αὐτὰ πέρατα ἐχούσης αὐτῆ. ὁμοίως δὲ καὶ τοῦ ἐν τῷ ἐτέρῳ ἡμισφαιρίῳ σχήματος ἡ ἐπιφάνεια ἐλάσσων ἐστὶν τῆς τοῦ ἡμισφαιρίου ἐπιφανείας· καὶ ὅλη οὖν ἡ ἐπιφάνεια τοῦ σχήματος τοῦ ἐν τῷ σφαίρα ἐλάσσων ἐστὶν τῆς ἐπιφανείας τῆς σφαίρας.

 $[^]a$ Archimedes would not have omitted to make the deduc-94

MN will traverse the surface of a certain cone whose base is the circle about the diameter MH and whose vertex is the point in which ZH, MN produced meet one another and with A\Gamma; the sides BH, M Δ will traverse the surface of a cone whose base is the circle about the diameter $B\Delta$ at right angles to the circle ABI Δ and whose vertex is the point in which BH, ΔM produced meet one another and with ΓA ; in the same way the sides in the other semicircle will traverse surfaces of cones similar to these. As a result there will be inscribed in the sphere and bounded by the aforesaid surfaces of cones a figure whose surface will be less than the surface of the sphere.

For, if the sphere be cut by the plane through $B\Delta$ at right angles to the circle $AB\Gamma\Delta$, the surface of one of the hemispheres and the surface of the figure inscribed in it have the same extremities in one plane; for the extremity of both surfaces is the circumference of the circle about the diameter $B\Delta$ at right angles to the circle $AB\Gamma\Delta$; and both are concave in the same direction, and one of them is included by the other surface and the plane having the same extremities with it. Similarly the surface of the figure inscribed in the other hemisphere is less than the surface of the figure in the sphere is less than the surface of the sphere.

tion, from Postulate 4, that the surface of the figure inscribed in the hemisphere is less than the surface of the hemisphere.

κδ΄

96

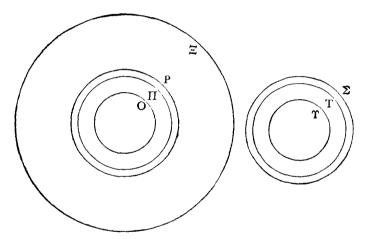

Prop. 24

The surface of the figure inscribed in the sphere is equal to a circle, the square of whose radius is equal to the rectangle contained by the side of the figure and a straight line equal to the sum of the straight lines joining the angles of the polygon, being parallel to the straight line subtended by two sides of the polygon.

Let $AB\Gamma\Delta$ be the greatest circle in a sphere, and in it let there be inscribed an equilateral polygon, the number of whose sides is divisible by four, and, starting from the inscribed polygon, let there be imagined a figure inscribed in the sphere, and let EZ, H θ , $\Gamma\Delta$, K Λ , MN be joined, being parallel to the straight line subtended by two sides; now let there be set out a circle Ξ , the square of whose radius is equal to the rectangle contained by AE and a straight line equal to the sum of EZ, H θ , $\Gamma\Delta$, K Λ , MN; I say that this circle is equal to the surface of the figure inscribed in the sphere.

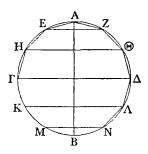

For let the circles O, Π , P, Σ , T, Y be set out, and let the square of the radius of O be equal to the rectangle contained by EA and the half of EZ, let the square of the radius of Π be equal to the rectangle contained by EA and the half of EZ + H Θ , let the square of the radius of P be equal to the rectangle contained by EA and the half of H Θ + $\Gamma\Delta$, let the square of the radius of Σ be equal to the rectangle contained by EA and the half of $\Gamma\Delta$ + K Λ , let the square of the radius of T be equal to the rectangle

τῶν ΚΛ, ΜΝ, ἡ δὲ ἐκ τοῦ κέντρου τοῦ Υ δυνάσθω τὸ περιεχόμενον ὑπό τε τῆς ΑΕ καὶ τῆς ἡμισείας τῆς ΜΝ. διὰ δὴ ταῦτα ὁ μὲν Ο κύκλος ἴσος ἐστὶ τῆ ἐπιφανεία τοῦ ΑΕΖ κώνου, ὁ δὲ Π τῆ ἐπιφανεία τοῦ κώνου τῆ μεταξὺ τῶν ΕΖ, ΗΘ, ὁ δὲ P τῆ μεταξὺ τῶν ΗΘ, ΓΔ, ὁ δὲ P τῆ μεταξὺ τῶν

ΔΓ, ΚΛ, καὶ ἔτι ὁ μὲν Τ ἴσος ἐστὶ τῆ ἐπιφανεία τοῦ κώνου τῆ μεταξὺ τῶν ΚΛ, ΜΝ, ὁ δὲ ϒ τῆ τοῦ ΜΒΝ κώνου ἐπιφανεία ἴσος ἐστίν· οἱ πάντες ἄρα κύκλοι ἴσοι εἰσὶν τῆ τοῦ ἐγγεγραμμένου σχήματος ἐπιφανεία. καὶ φανερόν, ὅτι αἱ ἐκ τῶν κέντρων τῶν Ο, Π, Ρ, Σ, Τ, ϒ κύκλων δύνανται τὸ περιεχόμενον ὑπό τε τῆς ΑΕ καὶ δὶς τῶν ἡμίσεων τῆς ΕΖ, ΗΘ, ΓΔ, ΚΛ, ΜΝ, αἱ ὅλαι εἰσὶν 98

contained by AE and the half of $K\Lambda + MN$, and let the square of the radius of Υ be equal to the rect angle contained by AE and the half of MN. Now by these constructions the circle O is equal to the surface of the cone AEZ [Prop. 14], the circle II is equal to the surface of the conical frustum between EZ and H θ , the circle P is equal to the surface of the conical frustum between H θ and $\Gamma\Delta$, the circle Σ is

equal to the surface of the conical frustum between $\Delta\Gamma$ and $K\Lambda$, the circle T is equal to the surface of the conical frustum between $K\Lambda$, MN [Prop. 16], and the circle Y is equal to the surface of the cone MBN [Prop. 14]; the sum of the circles is therefore equal to the surface of the inscribed figure. And it is manifest that the sum of the squares of the radii of the circles O, Π , P, Σ , T, Y is equal to the rectangle contained by AE and twice the sum of the halves of EZ, H Θ , $\Gamma\Delta$, K Λ , MN, that is to say, the sum of EZ,

αἱ ΕΖ, ΗΘ, ΓΔ, ΚΛ, ΜΝ· αἱ ἄρα ἐκ τῶν κέντρων τῶν Ο, Π, Ρ, Σ, Τ, ϒ κύκλων δύνανται τὸ περιεχόμενον ὑπό τε τῆς ΑΕ καὶ πασῶν τῶν ΕΖ, ΗΘ, ΓΔ, ΚΛ, ΜΝ. ἀλλὰ καὶ ἡ ἐκ τοῦ κέντρου τοῦ Ξ κύκλου δύναται τὸ ὑπὸ τῆς ΑΕ καὶ τῆς συγκειμένης ἐκ πασῶν τῶν ΕΖ, ΗΘ, ΓΔ, ΚΛ, ΜΝ· ἡ ἄρα ἐκ τοῦ κέντρου τοῦ Ξ κύκλου δύναται τὰ ἀπὸ τῶν ἐκ τῶν κέντρων τῶν Ο, Π, Ρ, Σ, Τ, ϒ κύκλων· καὶ ὁ κύκλος ἄρα ὁ Ξ ἴσος ἐστὶ τοῖς Ο, Π, Ρ, Σ, Τ, ϒ κύκλοι ἀπεδείχθησαν ἴσοι τῆ εἰρημένη τοῦ σχήματος ἐπιφανεία καὶ ὁ Ξ ἄρα κύκλος ἴσος ἔσται τῆ ἐπιφανεία τοῦ σχήματος.

 $=\pi$. AE . (EZ + H Θ + $\Gamma\Delta$ + K Λ + MN).

Now AE = $2a \sin \frac{\pi}{4n}$, and by p. 91 n. b

^a If the radius of the sphere is a this proposition shows that Surface of inscribed figure = circle Ξ

 $H\Theta$, $\Gamma\Delta$, $K\Lambda$, MN; therefore the sum of the squares of the radii of the circles O, II, P, Σ , T, Υ is equal to the rectangle contained by AE and the sum of EZ, $H\Theta$, $\Gamma\Delta$, $K\Lambda$, MN. But the square of the radius of the circle Ξ is equal to the rectangle contained by AE and a straight line made up of EZ, $H\Theta$, $\Gamma\Delta$, $K\Lambda$, MN [ex hypothess]; therefore the square of the radius of the circle Ξ is equal to the sum of the squares of the radii of the circles O, II, P, Σ , T, Υ ; and therefore the circle Ξ is equal to the sum of the circles O, II, P, Σ , T, Υ was shown to be equal to the surface of the aforesaid figure; and therefore the circle Ξ will be equal to the surface of the figure.

Prop. 25

The surface of the figure inscribed in the sphere and bounded by the surfaces of cones is less than four times the greatest of the circles in the sphere.

Let ABΓΔ be the greatest circle in a sphere, and in it let there be inscribed an equilateral polygon, the number of whose sides is divisible by four, and, starting from it, let a surface bounded by surfaces of

EZ + H
$$\Theta$$
 + $\Gamma\Delta$ + K Λ + MN = $2a\left[\sin\frac{\pi}{2n} + \sin\frac{2\pi}{2n} + \dots + \sin\left(2n-1\right)\frac{\pi}{2n}\right]$.

$$\therefore \text{ Surface of inscribed figure} = 4\pi a^2 \sin\frac{\pi}{4n}\left[\sin\frac{\pi}{2n} + \sin\frac{2\pi}{2n} + \dots + \sin\left(2n-1\right)\frac{\pi}{2n}\right]$$

$$= 4\pi a^2 \cos\frac{\pi}{4n}$$
[by p. 91 n. b. 101

sphere, having the same centre as the lesser sphere: the points of contact in which the sides touch [the smaller circle] will describe circles on the lesser sphere at right angles to the circle $AB\Gamma\Delta$, and the angles of the polygon, except those at the points E, H will traverse the circumferences of circles on the surface of the greater sphere at right angles to the circle EZHO, while the sides of the polygon will traverse surfaces of cones, as in the former case: there will therefore be a figure, bounded by surfaces of cones, described about the lesser sphere and inscribed in the greater. That the surface of the circumscribed figure is greater than the surface of the sphere will be proved thus.

Let $K\Delta$ be a diameter of one of the circles in the lesser sphere, K, Δ being points at which the sides of the circumscribed polygon touch the circle $AB\Gamma\Delta$. Now, since the sphere is divided by the plane containing $K\Delta$ at right angles to the circle $AB\Gamma\Delta$, the surface of the figure circumscribed about the sphere will be divided by the same plane. And it is manifest that they a have the same extremities in a plane; for the extremity of both surfaces b is the circumference of the circle about the diameter $K\Delta$ at right angles to the circle $AB\Gamma\Delta$: and they are both concave in the same direction, and one of them is included by the other and the plane having the same extremities; therefore the included surface of the segment of the sphere is less than the surface of

b In the text ἐπιπέδων should obviously be ἐπιφανειῶν.

$$a'=a\sec\frac{\pi}{4n}$$
.

This proposition shows that Area of figure circumscribed to circle of radius a = Area of figure inscribed in circle of radius a'

^a If the radius of the inner sphere is a and that of the outer sphere a', and the regular polygon has 4n sides, then

the figure circumscribed about it [Post. 4]. Similarly the surface of the remaining segment of the sphere is less than the surface of the figure circumscribed about it; it is clear therefore that the whole surface of the sphere is less than the surface of the figure circumscribed about it.

Prop. 29

The surface of the figure circumscribed about the sphere is equal to a circle, the square of whose radius is equal to the rectangle contained by one side of the polygon and a straight line equal to the sum of all the straight lines joining the angles of the polygon, being parallel to one of the straight lines subtended by two sides of the polygon.

For the figure circumscribed about the lesser sphere is inscribed in the greater sphere [Prop. 28]; and it has been proved that the surface of the figure inscribed in the sphere and formed by surfaces of cones is equal to a circle, the square of whose radius is equal to the rectangle contained by one side of the polygon and a straight line equal to the sum of all the straight lines joining the angles of the polygon, being parallel to one of the straight lines subtended by two sides [Prop. 24]; what was aforesaid is therefore obvious.^a

Prop. 30

The surface of the figure circumscribed about the sphere is greater than four times the greatest of the circles in the sphere.

For let there be both the sphere and the circle and the other things the same as were posited before, and let the circle Λ be equal to the surface of the given figure circumscribed about the lesser sphere.

Therefore since in the circle EZH θ there has been inscribed an equilateral polygon with an even number of angles, the [sum of the straight lines] joining the sides of the polygon, being parallel to Z θ , have the same ratio to Z θ as θ K to KZ [Prop. 21]; therefore the rectangle contained by one side of the polygon and the straight line equal to the sum of the straight lines joining the angles of the polygon is equal to the rectangle contained by Z θ , θ K [Eucl. vi. 16]; so that the square of the radius of the circle Λ is equal to the rectangle contained by Z θ , θ K

ἐστὶν ἡ ἐκ τοῦ κέντρου τοῦ Λ κύκλου τῆς ΘΚ. ἡ δὲ ΘΚ ἴση ἐστὶ τῆ διαμέτρω τοῦ $AB\Gamma\Delta$ κύκλου [διπλασία γάρ ἐστιν τῆς $X\Sigma$ οὔσης ἐκ τοῦ κέντρου τοῦ $AB\Gamma\Delta$ κύκλου]. δῆλον οὖν, ὅτι μείζων ἐστὶν ἢ τετραπλάσιος ὁ Λ κύκλος, τουτέστιν ἡ ἐπιφάνεια τοῦ περιγεγραμμένου σχήματος περὶ τὴν ἐλάσσονα σφαῖραν, τοῦ μεγίστου κύκλου τῶν ἐν τῆ σφαίρą.

¹ διπλασία . . . κύκλου om. Heiberg.

Because ZΘ>ΘΚ [Eucl. iii. 15].

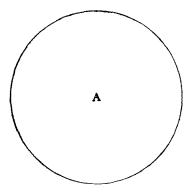

[Prop. 29]. Therefore the radius of the circle Λ is greater than $\Theta K.^a$ Now ΘK is equal to the diameter of the circle $AB\Gamma \Delta$; it is therefore clear that the circle Λ , that is, the surface of the figure circumscribed about the lesser sphere, is greater than four times the greatest of the circles in the sphere.

Prop. 33

The surface of any sphere is four times the greatest of the circles in it.

For let there be a sphere, and let A be four times the greatest circle; I say that A is equal to the surface of the sphere.

For if not, either it is greater or less. First, let the surface of the sphere be greater than the circle.

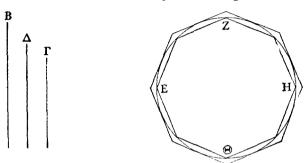

Then there are two unequal magnitudes, the surface of the sphere and the circle A; it is therefore possible to take two unequal straight lines so that the greater bears to the less a ratio less than that which the sur-

ἐπιφάνεια τῆς σφαίρας πρὸς τὸν κύκλον. εἰλή-φθωσαν αἱ Β, Γ, καὶ τῶν Β, Γ μέση ἀνάλογον έστω ή Δ, νοείσθω δὲ καὶ ή σφαῖρα ἐπιπέδω τετμημένη διὰ τοῦ κέντρου κατὰ τὸν ΕΖΗΘ κύκλον, νοείσθω δε καὶ είς τον κύκλον εγγεγραμμένον καὶ περιγεγραμμένον πολύγωνον, ώστε ομοιον είναι τὸ περιγεγραμμένον τῶ έγγεγραμμένω πολυγώνω και την τοῦ περιγεγραμμένου πλευράν και δ διπλάσιος ἄρα λόγος τοῦ βιπλασίου λόγου ἐχειν τοῦ, δν ἔχει ἡ \mathbf{B} πρὸς $\mathbf{\Delta}$ [καὶ δ διπλάσιος ἄρα λόγος τοῦ διπλασίου λόγου ἐστὶν ἐλάσσων. καὶ τοῦ μὲν τῆς \mathbf{B} πρὸς $\mathbf{\Delta}$ διπλάσ σιός έστιν ο της Β προς την Γ, της δε πλευρας τοῦ περιγεγραμμένου πολυγώνου πρός τὴν πλευράν τοῦ ἐγγεγραμμένου διπλάσιος ὁ τῆς ἐπιφανείας τοῦ περιγεγραμμένου στερεού πρός την επιφάνειαν του έγγεγραμμένου ή επιφάνεια άρα τοῦ περιγεγραμμένου σχήματος περί την σφαίραν πρός την έπιφάνειαν τοῦ ἐγγεγραμμένου σχήματος ἐλάσσονα λόγον ἔχει ἤπερ ἡ ἐπιφάνεια τῆς σφαίρας πρὸς τὸν Α κύκλον ὅπερ ἄτοπον ἡ μὲν γὰρ ἐπιφάνεια τοῦ περιγεγραμμένου της επιφανείας της σφαίρας μείζων εστίν, ή δε επιφάνεια τοῦ εγγεγραμμένου σχήματος τοῦ Α κύκλου ἐλάσσων ἐστί [δέδεικται γαρ ή επιφάνεια τοῦ εγγεγραμμένου ελάσσων τοῦ μεγίστου κύκλου των έν τη σφαίρα η τετραπλασία. τοῦ δὲ μεγίστου κύκλου τετραπλάσιός ἐστιν ὁ Α κύκλος]. οὐκ ἄρα ἡ ἐπιφάνεια τῆς σφαίρας μείζων έστι τοῦ Α κύκλου.

καὶ . . . ἐγγεγραμμένου om. Heiberg.
 δέδεικται . . . κύκλος "repetitionem inutilem Prop. 25," om. Heiberg.

face of the sphere bears to the circle [Prop. 2]. Let B, Γ be so taken, and let Δ be a mean proportional between B, Γ , and let the sphere be imagined as cut

through the centre along the [plane of the] circle EZHO, and let there be imagined a polygon inscribed in the circle and another circumscribed about it in such a manner that the circumscribed polygon is similar to the inscribed polygon and the side of the circumscribed polygon has to the side of the inscribed polygon] a ratio less than that which B has to Δ [Prop. 3]. Therefore the surface of the figure circumscribed about the sphere has to the surface of the inscribed figure a ratio less than that which the surface of the sphere has to the circle A; which is absurd; for the surface of the circumscribed figure is greater than the surface of the sphere [Prop. 28], while the surface of the inscribed figure is less than the circle A [Prop. 25]. Therefore the surface of the sphere is not greater than the circle A.

^a Archimedes would not have omitted: πρὸς τὴν τοῦ ἐγγεγραμμίνου.

Λέγω δή, ὅτι οὐδὲ ἐλάσσων. εἰ γὰρ δυνατόν, ἔστω· καὶ ὁμοίως εὐρήσθωσαν αἱ Β, Γ εὐθεῖαι, ὅστε τὴν Β πρὸς Γ ἐλάσσονα λόγον ἔχειν τοῦ, ὅν ἔχει ὁ Α κύκλος πρὸς τὴν ἐπιφάνειαν τῆς σφαίρας, καὶ τῶν Β, Γ μέση ἀνάλογον ἡ Δ, καὶ ἐγγεγράφθω καὶ περιγεγράφθω πάλιν, ὥστε τὴν τοῦ περιγεγραμμένου ἐλάσσονα λόγον ἔχειν τοῦ τῆς Β πρὸς Δ [καὶ τὰ διπλάσια ἄρα]¹· ἡ ἐπιφάνεια ἄρα τοῦ περιγεγραμμένου πρὸς τὴν ἐπιφάνειαν τοῦ ἐγγεγραμμένου ἐλάσσονα λόγον ἔχει ἤπερ [ἡ Β πρὸς Γ. ἡ δὲ Β πρὸς Γ ἐλάσσονα λόγον ἔχει ἤπερ]² ὁ Α κύκλος πρὸς τὴν ἐπιφάνειαν τῆς σφαίρας. ὅπερ ἄτοπον· ἡ μὲν γὰρ τοῦ περιγεγραμμένου ἐπιφάνεια μείζων ἐστὶ τοῦ Α κύκλου, ἡ δὲ τοῦ ἐγγεγραμμένου ἐλάσσων τῆς ἐπιφανείας τῆς σφαίρας.

Οὐκ ἄρα οὐδὲ ἐλάσσων ἡ ἐπιφάνεια τῆς σφαίρας τοῦ Α κύκλου. ἐδείχθη δέ, ὅτι οὐδὲ μείζων ἡ ἄρα ἐπιφάνεια τῆς σφαίρας ἴση ἐστὶ τῷ Α κύκλῳ, τουτέστι τῶ τετραπλασίω τοῦ μεγίστου κύκλου.

1
 καὶ . . . ἄρα om. Heiberg. 2 ἡ B . . . ἡπερ om. Heiberg.

a Archimedes would not have omitted these words.

^b On p. 100 n. a it was proved that the area of the inscribed figure is

$$4\pi a^2 \sin\frac{\pi}{n} \left[\sin\frac{\pi}{2n} + \sin\frac{2\pi}{2n} + \dots + \sin(2n-1)\frac{\pi}{2n} \right],$$

or $4\pi a^2 \cos \frac{\pi}{1a}$.

On p. 108 n. a it was proved that the area of the circumscribed figure is

$$4\pi a^2 \sec^2 \frac{\pi}{4n} \sin \frac{\pi}{4n} \left[\sin \frac{\pi}{2n} + \sin \frac{2\pi}{2n} + \dots + \sin (2n-1) \frac{\pi}{2n} \right],$$

or $1\pi a^2 \sec \frac{\pi}{4n}$.

I say now that neither is it less. For, if possible let it be; and let the straight lines B, Γ be similarly found, so that B has to Γ a less ratio than that which the circle A has to the surface of the sphere, and let Δ be a mean proportional between B, Γ , and let [polygons] be again inscribed and circumscribed, so that the [side] of the circumscribed polygon has [to the side of the inscribed polygon] a less ratio than that of B to Δ ; then the surface of the circumscribed polygon a ratio less than that which the circle A has to the surface of the sphere; which is absurd; for the surface of the circumscribed polygon is greater than the circle A, while that of the inscribed polygon is less than the surface of the sphere.

Therefore the surface of the sphere is not less than the circle A. And it was proved not to be greater; therefore the surface of the sphere is equal to the circle A, that is to four times the greatest circle.^b

When n is indefinitely increased, the inscribed and circumscribed figures become identical with one another and with the circle, and, since $\cos \frac{\pi}{4n}$ and $\sec \frac{\pi}{4n}$ both become unity, the above expressions both give the area of the circle as $4\pi a^2$.

But the first expressions are, when n is indefinitely in-

creased, precisely what is meant by the integral

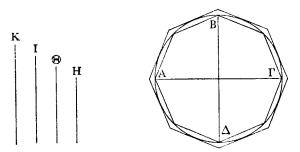

$$4\pi a^2 \cdot \frac{1}{2} \int_0^\pi \sin \phi \ d\phi$$

which is familiar to every student of the calculus as the formula for the area of a sphere and has the value $4\pi a^2$.

Thus Archimedes' procedure is equivalent to a genuine integration, but when it comes to the last stage, instead of saying, "Let the sides of the polygon be indefinitely

 $\lambda\delta'$

Πᾶσα σφαίρα τετραπλασία ἐστὶ κώνου τοῦ βάσιν μέν ἔχοντος ἴσην τῷ μεγίστῳ κύκλῳ τῶν ἐν τῆ σφαίρα, ὕψος δὲ τὴν ἐκ τοῦ κέντρου τῆς σφαίρας. Έστω γὰρ σφαῖρά τις καὶ ἐν αὐτῆ μέγιστος κύκλος ὁ $AB\Gamma\Delta$. εἰ οὖν μή ἐστιν ἡ σφαῖρα τε-

τραπλασία τοῦ εἰρημένου κώνου, ἔστω, εἰ δυνατόν, μείζων ἢ τετραπλασία. ἔστω δὲ ὁ Ξ κῶνος βάσιν μεν έχων τετραπλασίαν τοῦ ΑΒΓΔ κύκλου, ὕψος δὲ ἴσον τῆ ἐκ τοῦ κέντρου τῆς σφαίρας· μείζων οὖν ἐστιν ἡ σφαίρα τοῦ Ξ κώνου. ἔσται δὴ δύο μεγέθη ἄνισα ἥ τε σφαίρα καὶ ὁ κῶνος· δυνατὸν οὖν δύο εὐθείας λαβεῖν ἀνίσους, ὥστε ἔχειν τὴν

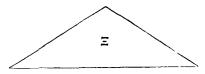

The procedure by which in this same book Archimedes 118

increased," he prefers to prove that the area of the sphere cannot be either greater or less than $4\pi a^2$. By this double reductio ad absurdum he avoids the logical difficulties of dealing with indefinitely small quantities, difficulties that were not fully overcome until recent times.

Prop. 34

Any sphere is four times as great as the cone having a base equal to the greatest of the circles in the sphere and height equal to the radius of the sphere.

For let there be a sphere in which $AB\Gamma\Delta$ is the greatest circle. If the sphere is not four times the

aforesaid cone, let it be, if possible, greater than four times; let Ξ be a cone having a base four times the circle ABF Δ and height equal to the radius of the sphere; then the sphere is greater than the cone Ξ . Accordingly there will be two unequal magnitudes, the sphere and the cone; it is therefore possible to take two unequal straight lines so that

finds the surface of the segment of a sphere is equivalent to the integration $% \frac{1}{2}\left(\frac{1}{2}\right) =\frac{1}{2}\left(\frac{1}{2}\right) +\frac{1}{2}\left(\frac$

$$\pi a^2 \int_0^a 2 \sin \theta \ d\theta = 2\pi a^2 (1 - \cos a).$$

Concurrently Archimedes finds the volumes of a sphere and segment of a sphere. He uses the same inscribed and circumscribed figures, and the procedure is equivalent to multiplying the above formulae by ½a throughout. Other "integrations" effected by Archimedes are the volume of a segment of a paraboloid of revolution, the volume of a segment of a spheroid, the area of a spiral and the area of a segment of a parabola. He also finds the area of an ellipse, but not by a method equivalent to integration. The subject is fully treated by Heath, The Works of Archimedes, pp. exlii-cliv, to whom I am much indebted in writing this note.

μείζονα πρὸς τὴν ἐλάσσονα ἐλάσσονα λόγον τοῦ, δν έχει ή σφαίρα πρὸς τὸν Ξ κῶνον. ἔστωσαν οὖν αί Κ, Η, αί δὲ Ι, Θ εἰλημμέναι, ὥστε τῶ ἴσω ἀλλήλων ύπερέχειν την Κ της Ι και την Ι της Θ και την Θ της Η, νοείσθω δὲ καὶ εἰς τὸν ΑΒΓΔ κύκλον έγγεγραμμένον πολύγωνον, οδ τὸ πληθος τῶν πλευρῶν μετρείσθω ὑπὸ τετράδος, καὶ ἄλλο περιγεγραμμένον ὅμοιον τῷ ἐγγεγραμμένω, καθάπερ επὶ τῶν πρότερον, ἡ δὲ τοῦ περιγεγραμμένου πολυγώνου πλευρά πρός την τοῦ έγγεγραμμένου έλάσσονα λόγον έχέτω τοῦ, ὃν ἔχει ἡ Κ΄ πρὸς Ι, καὶ ἔστωσαν αἱ ${\rm A}\Gamma,~{\rm B}\Delta$ διάμετροι πρὸς ὀρθὰς άλλήλαις. εί οὖν μενούσης τῆς ΑΓ διαμέτρου περιενεχθείη τὸ ἐπίπεδον, ἐν ὧ τὰ πολύγωνα, ἔσται σχήματα τὸ μὲν ἐγγεγραμμένον ἐν τῆ σφαίρα, τὸ δέ περιγεγραμμένον, καὶ έξει τὸ περιγεγραμμένον προς το έγγεγραμμένον τριπλασίονα λόγον ήπερ ή πλευρά τοῦ περιγεγραμμένου πρός την τοῦ έγγεγραμμένου είς τον ΑΒΓΔ κύκλον. ή δε πλευρά πρός την πλευράν ελάσσονα λόγον έχει ήπερ ή Κ πρός την Ι. ώστε τὸ σχημα τὸ περιγεγραμμένον έλάσσονα λόγον έχει η τριπλασίονα τοῦ Κ πρὸς Ι.

 1 σχήματα Heiberg, τὸ σχήμα codd.

Take x such that

Then

and since a > b,

But, by hypothesis,

Therefore

and so a: b = b: x. a - b: a = b - x: b, a - b > b - x. a - b = b - c. b - c > b - x, x > c.

^a Eutocius supplies a proof on these lines. Let the lengths of K, I, Θ , H be a, b, c, d. Then a-b=b-c=c-d, and it is required to prove that $a:d>a^3:b^3$.

the greater will have to the less a less ratio than that which the sphere has to the cone Ξ . Therefore let the straight lines K. H. and the straight lines I. θ. be so taken that K exceeds I, and I exceeds θ and θ exceeds H by an equal quantity; let there be imagined inscribed in the circle $AB\Gamma\Delta$ a polygon the number of whose sides is divisible by four: let another be circumscribed similar to that inscribed so that, as before, the side of the circumscribed polygon has to the side of the inscribed polygon a ratio less than that K:I; and let $A\Gamma$, $B\Delta$ be diameters at right angles. Then if, while the diameter A Γ remains stationary, the surface in which the polygons lie be revolved, there will result two [solid] figures, one inscribed in the sphere and the other circumscribed, and the circumscribed figure will have to the inscribed the triplicate ratio of that which the side of the circumscribed figure has to the side of the figure inscribed in the circle AB $\Gamma\Delta$ [Prop. 32]. But the ratio of the one side to the other is less than K: I [ex hypothesi]; and so the circumscribed figure has [to the inscribed] a ratio less than $K^3: I^3$. But $a K: H > K^3: I^3$; by much more there-

```
Then, as before b-x>x-y.

Therefore, a fortiori, b-c>x-y.

But, by hypothesis, b-c-c-d.

Therefore c-d>x-y.

But x>c,
and so y>d.

But, by hypothesis, a:b=b:x=x:y,
a:y=a^3:b^3 [Eucl. v. Def. 10, also vol. i.
```

Again, take y such that b:z=x:y.

Therefore $a: d > a^3: b^3$.

p. 258 n. b.

ἔχει δὲ καὶ ἡ Κ πρὸς Η μείζονα λόγον ἢ τριπλάσιον τοῦ, ὃν ἔχει ἡ Κ πρὸς Ι [τοῦτο γὰρ φανερὸν διὰ λημμάτων]¹· πολλῷ ἄρα τὸ περιγραφὲν πρὸς τὸ ἐγγραφὲν ἐλάσσονα λόγον ἔχει τοῦ, ὃν ἔχει ἡ Κ πρὸς Η. ἡ δὲ Κ πρὸς Η ἐλάσσονα λόγον ἔχει ἤπερ ἡ σφαῖρα πρὸς τὸν Ξ κῶνον· καὶ ἐναλλάξ· ὅπερ ἀδύνατον· τὸ γὰρ σχῆμα τὸ περιγεγραμμένον μεῖζόν ἐστι τῆς σφαίρας, τὸ δὲ ἐγγεγραμμένον ἔλασσον τοῦ Ξ κώνου [διότι ὁ μὲν Ξ κῶνος τετραπλάσιος ἐστι τοῦ κώνου τοῦ βάσιν μὲν ἔχοντος ἴσην τῷ ΑΒΓΔ κύκλῳ, ὕψος δὲ ἴσον τῆ ἐκ τοῦ κέντρου τῆς σφαίρας, τὸ δὲ ἐγγεγραμμένον σχῆμα ἔλασσον τοῦ εἰρημένου κώνου ἢ τετραπλάσιον]² οὐκ ἄρα μείζων ἢ τετραπλασία ἡ σφαῖρα τοῦ

fore the circumscribed figure has to the inscribed a ratio less than K: H. But K: H is a ratio less than that which the sphere has to the cone Ξ [ex hypothesi]; [therefore the circumscribed figure has to the inscribed a ratio less than that which the sphere has to the cone Ξ]; and permutando, [the circumscribed figure has to the sphere a ratio less than that which the inscribed figure has to the cone] α ; which is impossible; for the circumscribed figure is greater than the sphere [Prop. 28], but the inscribed figure is less than the cone Ξ [Prop. 27]. Therefore the sphere is not greater than four times the aforesaid cone.

Let it be, if possible, less than four times, so that the sphere is less than the cone Ξ . Let the straight lines K, H be so taken that K is greater than H and K: H is a ratio less than that which the cone Ξ has to the sphere [Prop. 2]; let the straight lines Θ , I be placed as before; let there be imagined in the circle $AB\Gamma\Delta$ one polygon inscribed and another circumscribed, so that the side of the circumscribed figure has to the side of the inscribed a ratio less than K:I; and let the other details in the construction be done as before. Then the circumscribed solid figure will have to the inscribed the triplicate ratio of that which the side of the figure circumscribed about the circle $AB\Gamma\Delta$ has to the side of the inscribed figure [Prop. 32]. But the ratio of the sides

^a A marginal note in one MS. gives these words, which Archimedes would not have omitted.

¹ τοῦτο . . . λημμάτων om. Heiberg.

² διότι . . . τετραπλάσιον om. Heiberg.

ηπερ ή Κ πρὸς Ι· ἔξει οὖν τὸ σχημα τὸ περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον ἐλάσσονα λόγον ἢ τριπλάσιον τοῦ, ὃν ἔχει ἡ Κ πρὸς τὴν Ι. ἡ δὲ Κ πρὸς τὴν Η μείζονα λόγον ἔχει ἢ τριπλάσιον τοῦ, ὃν ἔχει ἡ Κ πρὸς τὴν Ι. ἡ δὲ Κ πρὸς τὴν Η μείζονα λόγον ἔχει ἢ τριπλάσιον τοῦ, ὃν ἔχει ἡ Κ πρὸς τὴν Ι· ὅστε ἐλάσσονα λόγον ἔχει τὸ σχημα τὸ περιγεγραμμένον πρὸς τὸ ἐγγεγραμμένον ἢ ἡ Κ πρὸς τὴν Η. ἡ δὲ Κ πρὸς τὴν Η ἐλάσσονα λόγον ἔχει ἢ ὁ Ξ κῶνος πρὸς τὴν σφαίραν ὅπερ ἀδύνατον τὸ μὲν γὰρ ἐγγεγραμμένον ἔλασσόν ἐστι τῆς σφαίρας, τὸ δὲ περιγεγραμμένον μεῖζον τοῦ Ξ κώνου. οὐκ ἄρα οὐδὲ ἐλάσσων ἐστὶν ἢ τετραπλασία ἡ σφαίρα τοῦ κώνου τοῦ βάσιν μὲν ἔχοντος ἴσην τῷ ΑΒΓΔ κύκλῳ, ὕψος δὲ τὴν ἴσην τῆ ἐκ τοῦ κέντρου τῆς σφαίρας. ἐδείχθη δὲ, ὅτι οὐδὲ μείζων τετραπλασία ἄρα.

$[\Pi \acute{o} ho \iota \sigma \mu a]^{\scriptscriptstyle 1}$

Προδεδειγμένων δὲ τούτων φανερόν, ὅτι πᾶς κύλινδρος βάσιν μὲν ἔχων τὸν μέγιστον κύκλον τῶν ἐν τῆ σφαίρα, ὕψος δὲ ἴσον τῆ διαμέτρω τῆς σφαίρας, ἡμιόλιός ἐστι τῆς σφαίρας καὶ ἡ ἐπιφάνεια αὐτοῦ μετὰ τῶν βάσεων ἡμιολία τῆς

έπιφανείας της σφαίρας.

Ο μεν γὰρ κύλινδρος ὁ προειρημένος έξαπλάσιός εστι τοῦ κώνου τοῦ βάσιν μεν ἔχοντος τὴν αὐτήν, ὕψος δὲ ἴσον τἢ ἐκ τοῦ κέντρου, ἡ δὲ σφαῖρα δέδεικται τοῦ αὐτοῦ κώνου τετραπλασία οὖσα δῆλον οὖν, ὅτι ὁ κύλινδρος ἡμιόλιός ἐστι τῆς σφαίρας. πάλιν, ἐπεὶ ἡ ἐπιφάνεια τοῦ κυλίνδρου χωρὶς τῶν βάσεων ἴση δέδεικται κύκλω, οὖ ἡ ἐκ

¹ πέρισμα. The title is not found in some MSS.

is less than K: I [ex hypothesi]; therefore the circumscribed figure has to the inscribed a ratio less than $K^3: I^3$. But $K: H > K^3: I^3$; and so the circumscribed figure has to the inscribed a ratio less than K: H. But K: H is a ratio less than that which the cone \(\mathbb{E} \) has to the sphere \[[ex hypothesi] \]; \[[therefore the circumscribed figure has to the inscribed a ratio less than that which the cone E has to the sphere a; which is impossible; for the inscribed figure is less than the sphere [Prop. 28], but the circumscribed figure is greater than the cone E [Prop. 31, coroll.]. Therefore the sphere is not less than four times the cone having its base equal to the circle ABΓΔ, and height equal to the radius of the sphere. But it was proved that it cannot be greater: therefore it is four times as great.

[COROLLARY]

From what has been proved above it is clear that any cylinder having for its base the greatest of the circles in the sphere, and having its height equal to the diameter of the sphere, is one-and-a-half times the sphere, and its surface including the bases is one-and-a-half times the

surface of the sphere.

For the aforesaid cylinder is six times the cone having the same basis and height equal to the radius [from Eucl. xii. 10], while the sphere was proved to be four times the same cone [Prop. 34]. It is obvious therefore that the cylinder is one-and-a-half times the sphere. Again, since the surface of the cylinder excluding the bases has been proved equal to a circle

^a These words, which Archimedes would not have omitted, are given in a marginal note to one Ms.

τοῦ κέντρου μέση ἀνάλογόν ἐστι τῆς τοῦ κυλίνδρου πλευρᾶς καὶ τῆς διαμέτρου τῆς βάσεως, τοῦ δὲ εἰρημένου κυλίνδρου τοῦ περὶ τὴν σφαῖραν ἡ πλευρὰ ἴση ἐστὶ τῆ διαμέτρω τῆς βάσεως [δῆλον, ὅτι ἡ μέση αὐτῶν ἀνάλογον ἴση γίνεται τῆ διαμέτρω τῆς βάσεως],¹ ὁ δὲ κύκλος ὁ τὴν ἐκ τοῦ κέντρου ἔχων ἴσην τῆ διαμέτρω τῆς βάσεως τετραπλάσιός ἐστι τῆς βάσεως, τουτέστι τοῦ μεγίστου κύκλου τῶν ἐν τῆς σφαίρα, ἔσται ἄρα καὶ ἡ ἐπιφάνεια τοῦ κυλίνδρου χωρὶς τῶν βάσεων τετραπλασία τοῦ μεγίστου κύκλου. ὅλη ἄρα μετὰ τῶν βάσεων ἡ ἐπιφάνεια τοῦ κυλίνδρου έξαπλασία ἔσται τοῦ μεγίστου κύκλου. ἔστιν δὲ καὶ ἡ τῆς σφαίρας ἐπιφάνεια τετραπλασία τοῦ μεγίστου κύκλου. ὅλη ἄρα ἡ ἐπιφάνεια τοῦ κυλίνδρου ἡμιολία ἐστὶ τῆς ἐπιφάνειας τῆς σφαίρας.

(c) Solution of a Cubic Equation

Archim. De Sphaera et Cyl. ii., Prop. 4, Archim. ed. Heiberg i. 186. 15-192. 6

Τὴν δοθεῖσαν σφαῖραν τεμεῖν, ὥστε τὰ τμήματα τῆς σφαίρας πρὸς ἄλληλα λόγον ἔχειν τὸν αὐτὸν τῷ δοθέντι.

1 δήλον . . . βάσεως om. Heiberg.

(a) Analysis of this main problem in which it is reduced to a particular case of the general problem, "so to cut a given straight line ΔZ at X that XZ bears to the given

[&]quot;As the geometrical form of proof is rather diffuse, and may conceal from the casual reader the underlying nature of the operation, it may be as well to state at the outset the various stages of the proof. The problem is to cut a given sphere by a plane so that the segments shall have a given ratio, and the stages are:

whose radius is a mean proportional between the side of the cylinder and the diameter of the base [Prop. 13], and the side of the aforementioned cylinder circumscribing the sphere is equal to the diameter of the base, while the circle having its radius equal to the diameter of the base is four times the base [Eucl. xii. 2], that is to say, four times the greatest of the circles in the sphere, therefore the surface of the cylinder excluding the bases is four times the greatest circle; therefore the whole surface of the cylinder, including the bases, is six times the greatest circle. But the surface of the sphere is four times the greatest circle. Therefore the whole surface of the cylinder is one-and-a-half times the surface of the sphere.

(c) Solution of a Cubic Equation

Archimedes, On the Sphere and Cylinder ii., Prop. 4, Archim. ed. Heiberg i. 186, 15-192, 6

To cut a given sphere, so that the segments of the sphere shall have, one towards the other, a given ratio.^a

straight line the same ratio as a given area bears to the square on ΔX "; in algebraical notation, to solve the equation

$$\frac{a-x}{b} = \frac{c^2}{x^2}$$
, or $x^2(a-x) = bc^2$.

(b) Analysis of this general problem, in which it is shown that the required point can be found as the intersection of a parabola $[ax^2 = c^2y]$ and a hyperbola [(a-x)y = ab]. It is stated, for the time being without proof, that $x^2(a-x)$ is greatest when $x = \frac{1}{2}a$; in other words, that for a real solution $bc^2 > \frac{1}{2}$, a^3 .

(c) Synthesis of this general problem, according as bc^2 is greater than, equal to, or less than $-a^3$. If it be greater, there is no real solution; if equal, there is one real solution;

if less, there are two real solutions.

(d) Proof that $w^2(a-x)$ is greatest when $x=\frac{\pi}{2}a$, deferred

Έστω ή δοθείσα σφαίρα ή $AB\Gamma\Delta$ · δεί δή αὐτὴν τεμεῖν ἐπιπέδω, ὥστε τὰ τμήματα τῆς σφαίρας

πρός άλληλα λόγον έχειν τὸν δοθέντα.

(e) Proof that, if $bc^2 < \frac{4}{27}a^3$, there are always two real

¹ ἐπείπερ . . . κύκλον om. Heiberg.

in (b). This is done in two parts, by showing that (1) if x has any value less than $\frac{a}{2}a$, (2) if x has any value greater than $\frac{a}{2}a$, then $x^2(a-x)$ has a smaller value than when $x=\frac{a}{2}a$.

solutions.

⁽f) Proof that, in the particular case of the general problem to which Archimedes has reduced his original problem, there is always a real solution.

⁽g) Synthesis of the original problem.

Of these stages, (a) and (g) alone are found in our texts of Archimedes; but Eutocius found stages (b)-(d) in an old book, which he took to be the work of Archimedes; and he added stages (e) and (f) himself. When it is considered that all these stages are traversed by rigorous geometrical 128

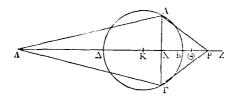

Let $AB\Gamma\Delta$ be the given sphere; it is required so to cut it by a plane that the segments of the sphere shall have, one towards the other, the given ratio.

Let it be cut by the plane $A\Gamma$; then the ratio of the segment $A\Delta\Gamma$ of the sphere to the segment $AB\Gamma$ of the sphere is given. Now let the sphere be cut through the centre [by a plane perpendicular to the plane through $A\Gamma$], and let the section be the great circle $AB\Gamma\Delta$ of centre K and diameter ΔB , and let $[\Lambda, P]$ be taken on $B\Delta$ produced in either direction so that

 $\mathbf{K}\Delta + \Delta\mathbf{X} : \Delta\mathbf{X} = \mathbf{P}\mathbf{X} : \mathbf{X}\mathbf{B},$

 $KB + BX : BX = \Lambda X : X\Delta$

and let $A\Lambda$, $\Lambda\Gamma$, AP, $P\Gamma$ be joined; then the cone $A\Lambda\Gamma$ is equal to the segment $A\Delta\Gamma$ of the sphere, and

the cone AP Γ to the segment AB Γ [Prop. 2]; therefore the ratio of the cone AA Γ to the cone AP Γ is given. But cone AA Γ : cone AP Γ =AX: XP. Therefore the ratio AX: XP is given. And in the

methods, the solution must be admitted a veritable tour de force. It is strictly analogous to the modern method of solving a cubic equation, but the concept of a cubic equation did not, of course, come within the purview of the ancient mathematicians.

^a Since they have the same base.

τερον διὰ τῆς κατασκευῆς, ώς ή ΛΔ πρὸς ΚΔ, ή ΚΒ πρὸς ΒΡ καὶ ή ΔΧ πρὸς ΧΒ. καὶ ἐπεί ἐστιν, ώς ή ΡΒ πρὸς ΒΚ, ή ΚΔ πρὸς ΛΔ, συνθέντι, ώς ή ΡΚ πρὸς ΚΒ, τουτέστι πρὸς ΚΔ, οὕτως ἡ ΚΛ πρὸς ΛΔ καὶ ὅλη ἄρα ἡ ΡΛ πρὸς ὅλην τὴν ΚΛ έστιν, ώς ή ΚΛ πρὸς ΛΔ. ἴσον ἄρα τὸ ὑπὸ τῶν ΡΛΔ τῶ ἀπὸ ΛΚ. ὡς ἄρα ἡ ΡΛ πρὸς ΛΔ, τὸ άπὸ ΚΛ πρὸς τὸ ἀπὸ ΛΔ. καὶ ἐπεί ἐστιν, ὡς ή ΔΔ πρὸς ΔΚ, οὕτως ή ΔΧ πρὸς ΧΒ, ἔσται ανάπαλιν καὶ συνθέντι, ώς ή ΚΛ πρὸς ΛΔ, οὕτως ή ΒΔ πρὸς ΔΧ Γκαὶ ώς ἄρα τὸ ἀπὸ ΚΛ πρὸς τὸ άπὸ ΛΔ, οὕτως τὸ ἀπὸ ΒΔ πρὸς τὸ ἀπὸ ΔΧ. πάλιν, ἐπεί ἐστιν, ὡς ἡ ΛΧ πρὸς ΔΧ, συναμ-φότερος ἡ ΚΒ, ΒΧ πρὸς ΒΧ, διελόντι, ὡς ἡ ΛΔ πρὸς ΔΧ, ούτως ή ΚΒ πρὸς ΒΧ]. καὶ κείσθω τη ΚΒ ἴση ή ΒΖ. ὅτι γὰρ ἐκτὸς τοῦ Ρ πεσεῖται, δηλον Γκαί έσται, ώς ή ΛΔ πρὸς ΔΧ, οὔτως ή ZB πρὸς BX: ὤστε καί, ὡς ἡ ΔΛ πρὸς ΛΧ, ἡ BZ πρὸς ZX].² ἐπεὶ δὲ λόγος ἐστὶ τῆς ΔΛ πρὸς ΛΧ δοθείς, καὶ τῆς ΡΛ ἄρα πρὸς ΛΧ λόγος ἐστὶ

¹ καὶ . . . πρὸς BX. The words καὶ . . . ἀπὸ ΔX are shown by Eutocius's comment to be an interpolation. The words πάλιν . . . πρὸς BX and καὶ . . . πρὸς ŽX must also be interpolated, as, in order to prove that $\Delta \Lambda : \Lambda X$ is given, Eutocius first proves that BZ: $ZX = A\Delta : AX$, which he would hardly have done if Archimedes had himself provided the proof.

² καὶ . . . πρὸς ZX; v. preceding note.

" This is proved by Eutocius thus: Since

dirimendo. and permutando,

i.e.,

Again, since

 $K\Delta + \Delta X : \Delta X = PX : XB$

 $K\Delta : \Delta X = PB : BX$ $K\Delta : BP = \Delta X : XB$.

 $KB : BP = \Delta X : XB$.

 $KB + BX : XB = \Lambda X : X\Delta$

130

same way as in a previous proposition [Prop. 2], by construction,

$$A\Delta : K\Delta = KB : BP = \Delta X : XB.a$$

And since $PB : BK = K\Delta : \Lambda\Delta$, [Eucl. v. 7, coroll.

componendo, $PK : KB = K\Lambda : \Lambda \Delta$, [Eucl. v. 18]

i.e., $PK : K\Delta = K\Lambda : \Lambda\Delta$.

 $\therefore \qquad \text{PA}: \text{KA} = \text{KA}: \text{A} \triangle. \qquad \text{[Eucl. v. 12]}$

 $... \qquad P\Lambda \cdot \Lambda \Delta = \Lambda K^2. \qquad [Eucl. vi. 17]$

 $\therefore \qquad \text{P}\Lambda : \Lambda \Delta = \text{K}\Lambda^2 : \Lambda \Delta^2.$

And since $\Lambda \Delta : \Delta K = \Delta X : XB$,

invertendo et componendo, $KA : A\Delta = B\Delta : \Delta X$. [Eucl. v. 7, coroll. and v. 18]

Let BZ be placed equal to KB. It is plain that [Z] will fall beyond P.^b Since the ratio $\Delta\Lambda : \Lambda X$ is given, therefore the ratio PA: ΛX is given.^c Then,

dirimendo et permutando $\Delta X : XB = A\Delta : \Delta K.$ Now $\Delta X : XB = KB : BP.$

Therefore $\Lambda \Delta : \Delta K = \Delta X : XB = KB : BP$.

 b Since XΔ: XB=KB: BP, and ΔX>XB, ∴ KB>BP. ∴ BZ>BP.

° As Eutocius's note shows, what Archimedes wrote was: "Since the ratio $\Delta \Lambda: \Lambda X$ is given, and the ratio $P\Lambda: \Lambda X$, therefore the ratio $P\Lambda: \Lambda \Delta$ is also given." Eutocius's proof is:

Since $KB + BX : BX = \Lambda X : X\Delta$,

 $ZX : XB = \Lambda X : X\Delta ;$ $XZ : ZB = X\Lambda : \Lambda\Delta ;$

 $XZ : ZB = XA : A\Delta :$ $BZ : ZX = A\Delta : AX.$

But the ratio BZ: ZX is given because ZB is equal to the radius of the given sphere and BX is given. Therefore $\Lambda\Delta: \Lambda X$ is given.

Again, since the ratio of the segments is given, the ratio of

δοθείς. ἐπεὶ οὖν ὁ τῆς ΡΛ πρὸς ΛΧ λόγος συνηπται έκ τε τοῦ, δν έχει ή PΛ πρὸς ΛΔ, καὶ ή ΔΛ πρὸς ΛΧ, ἀλλ' ὡς μὲν ἡ ΡΛ πρὸς ΛΔ, τὸ ἀπὸ ΔΒ πρὸς τὸ ἀπὸ ΔΧ, ὡς δὲ ἡ ΔΛ πρὸς ΛΧ, ούτως ή ΒΖ πρὸς ΖΧ, ὁ ἄρα τῆς ΡΛ πρὸς ΛΧ λόγος συνηπται έκ τε τοῦ, ὃν έχει τὸ ἀπὸ ΒΔ πρὸς τὸ ἀπὸ ΔΧ, καὶ ἡ ΒΖ πρὸς ΖΧ. πεποιήσθω δέ, $\dot{\omega}_s$ $\dot{\eta}$ PΛ πρὸς ΛΧ, $\dot{\eta}$ BZ πρὸς Ζ Θ · λόγος δὲ τῆς PΛ πρὸς ΛΧ δοθείς· λόγος ἄρα καὶ τῆς ZB πρός ΖΘ δοθείς. δοθείσα δὲ ή ΒΖ-ἴση γάρ ἐστι τη έκ τοῦ κέντρου δοθείσα ἄρα καὶ ή ΖΘ. καὶ δ της ΒΖ άρα λόγος πρός ΖΘ συνηπται έκ τε τοῦ, ον έχει τὸ ἀπὸ ΒΔ πρὸς τὸ ἀπὸ ΔΧ, καὶ ή ΒΖ πρός ΖΧ. άλλ' δ ΒΖ πρός ΖΘ λόγος συνηπται έκ τε τοῦ τῆς ΒΖ πρὸς ΖΧ καὶ τοῦ τῆς ΖΧ πρὸς ΖΘ [κοινὸς ἀφηρήσθω ὁ τῆς ΒΖ πρὸς ΖΧ]. λοιπον άρα έστίν, ώς το άπο ΒΔ, τουτέστι δοθέν, προς το από ΔΧ, ούτως ή ΧΖ προς ΖΘ, τουτέστι πρός δοθέν, καί έστιν δοθείσα ή ΖΔ εὐθεία. εὐθεῖαν ἄρα δοθεῖσαν τὴν ΔΖ τεμεῖν δεῖ κατὰ τὸ Χ καὶ ποιείν, ώς τὴν ΧΖ πρὸς δοθείσαν [τὴν ΖΘ]. ούτως τὸ δοθὲν [τὸ ἀπὸ ΒΔ] πρὸς τὸ ἀπὸ ΔΧ. τοῦτο οὕτως ἀπλῶς μὲν λεγόμενον ἔχει διορισμόν.

 2 τὴν ZΘ, τὸ ἀπὸ BΔ. Eutocius's comments show these words to be glosses.

 $^{^{1}}$ kouvos . . . $\pi \rho \delta s$ ZX. Eutocius's comment shows that these words are interpolated.

the cones $A\Lambda\Gamma$, $AP\Gamma$ is also given, and therefore the ratio $\Lambda X: XP$. Therefore the ratio $P\Lambda: \Lambda X$ is given. Since the ratios $P\Lambda: \Lambda X$ and $\Lambda\Delta: \Lambda X$ are given, it follows that the ratio $P\Lambda: \Lambda\Delta$ is given.

since the ratio $P\Lambda:\Lambda X$ is composed of the ratios $P\Lambda:\Lambda\Delta$ and $\Delta\Lambda:\Lambda X$,

and since

$$P\Lambda : \Lambda \Delta = \Delta B^2 : \Delta X^2, \sigma$$

$$\Delta \Lambda : \Lambda X = BZ : ZX$$

therefore the ratio PA:AX is composed of the ratios $B\Delta^2:\Delta X^2$ and BZ:ZX. Let $[\Theta$ be chosen so that]

$$PA : AX = BZ : Z\Theta$$

Now the ratio PA : AX is given; therefore the ratio $ZB : Z\Theta$ is given. Now BZ is given—for it is equal to the radius; therefore $Z\Theta$ is also given. Therefore b the ratio $BZ : Z\Theta$ is composed of the ratios $B\Delta^2 : \Delta X^2$ and BZ : ZX. But the ratio $BZ : Z\Theta$ is composed of the ratios BZ : ZX and $ZX : Z\Theta$. Therefore, the remainder c $B\Delta^2 : \Delta X^2 = XZ : Z\Theta$, in which $B\Delta^2$ and $Z\Theta$ are given. And the straight line $Z\Delta$ is given; therefore it is required so to cut the given straight line ΔZ at X that XZ bears to a given straight line the same ratio as a given area bears to the square on ΔX . When the problem is stated in this general form, d it is necessary to investigate the limits of possibility,

For
$$P\Lambda : \Lambda\Delta = \Lambda K^2 : \Delta\Lambda^2$$

= $B\Delta^2 : \Delta X.^2$

b "Therefore" refers to the last equation.

c i.e. the remainder in the process given fully by Eutocius as follows:

$$(B\Delta^2 : \Delta X^2) \cdot (BZ : ZX) = BZ : \Theta Z = (BZ : ZX) \cdot (XZ : Z\Theta)$$

Removing the common element BZ: ZX from the extreme terms, we find that the remainder $B\Delta^2: \Delta X^2 = XZ: Z\Theta$.

^d In algebraic notation, if $\Delta X = x$ and $\Delta Z = a$, while the given straight line is b and the given area is c^2 , then

$$\frac{a-x}{b} = \frac{c^2}{x^2},$$

$$\mathbf{z}^2(a-x) = bc^2.$$

 $^{^{\}sigma}$ In the technical language of Greek mathematics, the 134

but under the conditions of the present case no such investigation is necessary.^a In the present case the problem will be of this nature: Given two straight lines $B\Delta$, BZ, in which $B\Delta = 2BZ$, and a point Θ upon BZ, so to cut ΔB at X that

$$B\Delta^2: \Delta X^2 = XZ: Z\Theta$$
:

and the analysis and synthesis of both problems will be given at the end.

Eutocius, Commentary on Archimedes' Sphere and Cylinder ii., Archim. ed. Heiberg iii. 130, 17-150, 22

He promised that he would give at the end a proof of what is stated, but the fulfilment of the promise cannot be found in any of his extant writings. Dionysodorus also failed to light on it, and, being unable to tackle the omitted lemma, he approached the whole problem in an altogether different way, which I shall describe in due course. Diocles, indeed, in his work On Burning Mirrors maintained that Archimedes made the promise but had not fulfilled it, and he undertook to supply the omission himself, which attempt I shall also describe in its turn; it bears, however, no relation to the missing discussion, but, like that of Dionysodorus, it solves the problem by a construction reached by a different proof. But

general problem requires a diorismos, for which v. vol. i. p. 151 n. h and p. 396 n. a. In algebraic notation, there must be limiting conditions if the equation

$$x^2(a-x) = bc^2$$

is to have a real root lying between 0 and a.

b Having made this promise, Archimedes proceeded to give the formal synthesis of the problem which he had thus reduced.

βιβλίω—οὐδὲ γὰρ τῆς εἰς πολλὰ ζητήσεως ἀπέστη-μεν—ἐντετύχαμεν θεωρήμασι γεγραμμένοις οὐκ ὀλίγην μὲν τὴν ἐκ τῶν πταισμάτων ἔχουσιν ἀσάφειαν περί τε τὰς καταγραφὰς πολυτρόπως ἡμαρτημένοις, τῶν μέντοι ζητουμένων εἶχον τὴν ὑπόστασιν, ἐν μέρει δὲ τὴν ᾿Αρχιμήδει φίλην Δωρίδα γλῶσσαν ἀπέσωζον καὶ τοῖς συνήθεσι τῷ Δωρίδα γλώσσαν ἀπέσωζον καὶ τοῖς συνήθεσι τῷ ἀρχαίῳ τῶν πραγμάτων ὀνόμασιν ἐγέγραπτο τῆς μὲν παραβολῆς ὀρθογωνίου κώνου τομῆς ὀνομαζομένης, τῆς δὲ ὑπερβολῆς ἀμβλυγωνίου κώνου τομῆς, ὡς ἐξ αὐτῶν διανοεῖσθαι, μὴ ἄρα καὶ αὐτὰ εἴη τὰ ἐν τῷ τέλει ἐπηγγελμένα γράφεσθαι. ὅθεν σπουδαιότερον ἐντυγχάνοντες αὐτὸ μὲν τὸ ῥητόν, ὡς γέγραπται, διὰ πλῆθος, ὡς εἴρηται, τῶν πταισμάτων δυσχερὲς εὐρόντες τὰς ἐννοίας κατὰ μικρὸν ἀποσυλήσαντες κοινοτέρᾳ καὶ σαφεστέρᾳ κατὰ τὸ δυνατὸν λέξει γράφομεν. καθόλου δὲ πρῶτον τὸ θεώρημα γραφήσεται, ἴνα τὸ λεγόμενον ὑπ' αὐτοῦ σαφηνισθῆ περὶ τῶν διορισμῶν· εἶτα καὶ τοῖς ἀναλελυμένοις ἐν τῷ προβλήματι προσαρμοσθήσεται. σεται.

"Εὐθείας δοθείσης τῆς AB καὶ ἐτέρας τῆς ΑΓ καὶ χωρίου τοῦ Δ προκείσθω λαβεῖν ἐπὶ τῆς AB σημεῖον ὡς τὸ Ε, ὥστε εἶναι, ὡς τὴν ΑΕ πρὸς ΑΓ, οὕτω τὸ Δ χωρίον πρὸς τὸ ἀπὸ ΕΒ. "Γεγονέτω, καὶ κείσθω ἡ ΑΓ πρὸς ὀρθὰς τῆ AB, καὶ ἐπιζευχθεῖσα ἡ ΓΕ διήχθω ἐπὶ τὸ Z, καὶ ἤχθω διὰ τοῦ Γ τῆ AB παράλληλος ἡ ΓΗ, διὰ δὲ τοῦ B τῆ ΑΓ παράλληλος ἡ ZBH συμπίπτουσα

in a certain ancient book-for I pursued the inquiry thoroughly-I came upon some theorems which, though far from clear owing to errors and to manifold faults in the diagrams, nevertheless gave the substance of what I sought, and furthermore preserved in part the Doric dialect beloved by Archimedes, while they kept the names favoured by ancient custom, the parabola being called a section of a rightangled cone and the hyperbola a section of an obtuseangled cone; in short, I felt bound to consider whether these theorems might not be what he had promised to give at the end. For this reason I applied myself with closer attention, and, although it was difficult to get at the true text owing to the multitude of the mistakes already mentioned, gradually I routed out the meaning and now set it out, so far as I can, in more familiar and clearer language. In the first place the theorem will be treated generally, in order to make clear what he says about the limits of possibility; then will follow the special form it takes under the conditions of his analysis of the problem.

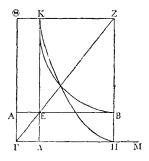

"Given a straight line AB and another straight line A Γ and an area Δ , let it be required to find a point E on AB such that AE : A $\Gamma = \Delta$: EB².

"Suppose it found, and let $A\Gamma$ be at right angles to AB, and let ΓE be joined and produced to Z, and through Γ let ΓH be drawn parallel to AB, and through B let ZBH be drawn parallel to A Γ , meeting

έκατέρα τῶν ΓΕ, ΓΗ, καὶ συμπεπληρώσθω τὸ ΗΘ παραλληλόγραμμον, καὶ διὰ τοῦ Ε ὁποτέρα τῶν ΓΘ, ΗΖ παράλληλος ἤχθω ἡ ΚΕΛ, καὶ τῷ Δ ἴσον ἔστω τὸ ὑπὸ ΓΗΜ.

" Έπεὶ οὖν ἐστιν, ὡς ἡ ΕΑ πρὸς ΑΓ, οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΕΒ, ὡς δὲ ἡ ΕΑ πρὸς ΑΓ, οὕτως ή ΓΗ πρὸς ΗΖ, ὡς δὲ ἡ ΓΗ πρὸς ΗΖ, οὕτως τὸ ἀπὸ ΓΗ πρὸς τὸ ὑπὸ ΓΗΖ, ὡς ἄρα τὸ ἀπὸ ΓΗ πρός τὸ ὑπὸ ΓΗΖ, οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΕΒ, τουτέστι πρὸς τὸ ἀπὸ ΚΖ· καὶ ἐναλλάξ, ὡς τὸ ἀπὸ ΓΗ πρὸς τὸ Δ, τουτέστι πρὸς τὸ ὑπὸ ΓΗΜ, οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ. άλλ' ώς τὸ ἀπὸ ΓΗ πρὸς τὸ ὑπὸ ΓΗΜ, οὕτως ή ΓΗ πρὸς ΗΜ· καὶ ώς ἄρα ή ΓΗ πρὸς ΗΜ, ούτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ. ἀλλ' ὡς ή ΓΗ πρὸς ΗΜ, τῆς ΗΖ κοινοῦ ὕψους λαμβανομένης οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ὑπὸ ΜΗΖ. ώς ἄρα τὸ ὑπὸ ΓΗΖ πρὸς τὸ ὑπὸ ΜΗΖ, οὕτως τὸ ὑπὸ ΓΗΖ πρὸς τὸ ἀπὸ ΖΚ. ἴσον ἄρα τὸ ὑπὸ ΜΗΖ τῷ ἀπὸ ΖΚ. ἐὰν ἄρα περὶ ἄξονα τὴν ΖΗ 138

both ΓE and ΓH , and let the parallelogram $H\Theta$ be completed, and through E let $KE\Lambda$ be drawn parallel

to either $\Gamma \Theta$ or HZ, and let [M be taken so that] $\Gamma H \cdot HM = \Delta$.

 $= \Delta : EB^2$ [ex hyp. Then, since EA: AI' $EA:A\Gamma$ and $=\Gamma H:HZ$ $\Gamma H : HZ = \Gamma H^2 : \Gamma H \cdot HZ$ and $\Gamma H^2 : \Gamma H . HZ = \Delta : EB^2$ ٠. $=\Delta:KZ^2$; and, permutando, $1'H^2:\Delta$ $[= \Gamma H \cdot HZ : ZK^2,]$ $\Gamma H^2 : \Gamma H : HM = \Gamma H : HZ : ZK^2$. i.e., But $\Gamma H^2 : \Gamma H . HM = \Gamma H : HM ;$ $\Gamma H : HM = \Gamma H : HZ : ZK^2$ ٠. But, by taking a common altitude HZ, $\Gamma H : HM = \Gamma H . HZ : MH . HZ$; $\Gamma H \cdot HZ : MH \cdot HZ = \Gamma H \cdot HZ : ZK^2$; $MH \cdot HZ = ZK^2$. ٠.

γραφη διὰ τοῦ Η παραβολή, ὥστε τὰς καταγομένας δύνασθαι παρὰ τὴν ΗΜ, ηξει διὰ τοῦ Κ, καὶ ἔσται θέσει δεδομένη διὰ τὸ δεδομένην εἶναι τὴν ΗΜ τῷ μεγέθει περιέχουσαν μετὰ τῆς ΗΓ δεδομένης δοθὲν τὸ Δ · τὸ ἄρα Κ ἄπτεται θέσει δεδομένης παραβολῆς. γεγράφθω οὖν, ὡς εἴρηται,

καὶ ἔστω ώς ἡ ΗΚ.

"Πάλιν, ἐπειδὴ τὸ ΘΛ χωρίον ἴσον ἐστὶ τῷ ΓΒ, τουτέστι τὸ ὑπὸ ΘΚΛ τῷ ὑπὸ ΑΒΗ, ἐὰν διὰ τοῦ Β περὶ ἀσυμπτώτους τὰς ΘΓ, ΓΗ γραφῷ ὑπερβολή, ἤξει διὰ τοῦ Κ διὰ τὴν ἀντιστροφὴν τοῦ η΄ θεωρήματος τοῦ δευτέρου βιβλίου τῶν ᾿Απολλωνίου Κωνικῶν στοιχείων, καὶ ἔσται θέσει δεδομένη διὰ τὸ καὶ έκατέραν τῶν ΘΓ, ΓΗ, ἔτι μὴν καὶ τὸ Β τῷ θέσει δεδόσθαι. γεγράφθω, ὡς εἴρηται, καὶ ἔστω ὡς ἡ ΚΒ· τὸ ἄρα Κ ἄπτεται θέσει δεδομένης ὑπερβολῆς. ἤπτετο δὲ καὶ θέσει δεδομένης παραβολῆς. δέδοται ἄρα τὸ Κ. καί ἐστιν ἀπ' αὐτοῦ κάθετος ἡ ΚΕ ἐπὶ θέσει δεδομένην τὴν ΑΒ· δέδοται ἄρα τὸ Ε. ἐπεὶ οὖν ἐστιν, ὡς ἡ ΕΑ πρὸς τὴν δοθεῖσαν τὴν ΑΓ, οὕτως δοθεν τὸ Δ πρὸς τὸ ἀπὸ ΕΒ, δύο στερεῶν, ὧν βάσεις τὸ ἀπὸ ΕΒ καὶ τὸ Δ, ὕψη δὲ αἱ ΕΑ, ΑΓ, ἀντιπεπόν

 $x^2 = \frac{c^2}{a}y,$

and the equation of the hyperbola is (a-x)y=ab.

Their points of intersection give solutions of the equation $x^2(a-x) = bx^2$.

^a Let AB = a, A Γ = b, and Δ = Γ H. HM = c^2 , so that HM = $\frac{c^2}{a}$. Then if H Γ be taken as the axis of x and HZ as the axis of y, the equation of the parabola is

If, therefore, a parabola be drawn through H about the axis ZH with the parameter HM, it will pass through K [Apoll. Con. i. 11, converse], and it will be given in position because HM is given in magnitude [Eucl. Data 57], comprehending with the given straight line HI the given area Δ ; therefore K lies on a parabola given in position. Let it then be drawn, as described, and let it be HK.

" Again, since the area $\Theta \Lambda = \Gamma B$ [Eucl. i. 43]

i.e., $\Theta K \cdot K\Lambda = AB \cdot BH$,

if a hyperbola be drawn through B having $\Theta\Gamma$, Γ H for asymptotes, it will pass through K by the converse to the eighth theorem of the second book of Apollonius's Elements of Conics, and it will be given in position because both the straight lines $\Theta\Gamma$, Γ H, and also the point B, are given in position. Let it be drawn, as described, and let it be KB; therefore K lies on a hyperbola given in position. But it lies also on a parabola given in position; therefore K is given.a And KE is the perpendicular drawn from it to the straight line AB given in position; therefore E is given. Now since the ratio of EA to the given straight line AI' is equal to the ratio of the given area Δ to the square on EB, we have two solids, whose bases are the square on EB and Δ and whose altitudes are EA, AI', and the bases are inversely pro-

to which, as already noted, Archimedes had reduced his problem. (N.B.—The axis of x is for convenience taken in a direction contrary to that which is usual; with the usual conventions, we should get slightly different equations.)

θασιν αἱ βάσεις τοῖς ὕψεσιν· ὥστε ἴσα ἐστὶ τὰ στερεά· τὸ ἄρα ἀπὸ ΕΒ ἐπὶ τὴν ΕΑ ἴσον ἐστὶ τῷ δοθέντι τῶ Δ ἐπὶ δοθεῖσαν τὴν ΓΑ. ἀλλὰ τὸ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ μέγιστόν ἐστι πάντων τῶν ὁμοίως λαμβανομένων έπὶ τῆς ΒΑ, ὅταν ἢ διπλασία ἡ ΒΕ της ΕΑ, ώς δειχθήσεται δεί ἄρα τὸ δοθὲν ἐπὶ τὴν δοθείσαν μη μείζον είναι τοῦ ἀπὸ της ΒΕ ἐπὶ την EA.

" Συντεθήσεται δὲ οὕτως ἔστω ή μὲν δοθεῖσα εὐθεῖα ἡ AB, ἄλλη δέ τις δοθεῖσα ἡ AΓ, τὸ δὲ δοθέν χωρίον τὸ Δ, καὶ δέον έστω τεμεῖν τὴν ΑΒ, ὤστε είναι, ώς τὸ εν τμημα πρὸς τὴν δοθείσαν τὴν ΑΓ, οὕτως τὸ δοθεν τὸ Δ πρὸς τὸ ἀπὸ τοῦ λοιποῦ τμήματος.

Εἰλήφθω τῆς ΑΒ τρίτον μέρος ἡ ΑΕ· τὸ ἄρα Δ επὶ τὴν $A\Gamma$ ήτοι μεῖζόν ἐστι τοῦ ἀπὸ τῆς BE ἐπὶ τὴν EA ἢ ἴσον ἢ ἔλασσον.

"Εὶ μὲν οὖν μεῖζόν ἐστιν, οὐ συντεθήσεται, ὡς ἐν τῆ ἀναλύσει δέδεικται εἰ δὲ ἴσον ἐστί, τὸ Ε σημεῖον ποιήσει τὸ πρόβλημα. ἴσων γὰρ ὄντων τῶν στερεῶν ἀντιπεπόνθασιν αἱ βάσεις τοῖς ύψεσιν, καί έστιν, ώς ή ΕΑ πρός ΑΓ, ούτως τὸ

 Δ πρὸς τὸ ἀπὸ ΒΕ. Έὶ δὲ ἔλασσόν ἐστι τὸ Δ ἐπὶ τὴν $\Lambda\Gamma$ τοῦ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ, συντεθήσεται οὕτως κείσθω ἡ ΑΓ πρὸς ὀρθὰς τῆ ΑΒ, καὶ διὰ τοῦ Γ τῆ ΑΒ παρ-

^a In our algebraical notation, $x^2(a-x)$ is a maximum when $x = \frac{2}{3}a$. We can easily prove this by the calculus. For, by differentiating and equating to zero, we see that $x^2(a-x)$ has 142

portional to the altitudes; therefore the solids are equal [Eucl. xi. 34]; therefore

$$EB^2 \cdot EA = \Delta \cdot \Gamma A$$
,

in which both Δ and I'A are given. But, of all the figures similarly taken upon BA, BE². BA is greatest when BE=2EA, a swill be proved; it is therefore necessary that the product of the given area and the given straight line should not be greater than

BE2 . EA.b

"The synthesis is as follows: Let AB be the given straight line, elet $\Delta\Gamma$ be any other given straight line, let Δ be the given area, and let it be required to cut AB so that the ratio of one segment to the given straight line A Γ shall be equal to the ratio of the given area Δ to the square on the remaining segment.

"Let AE be taken, the third part of AB; then Δ . AI is greater than, equal to or less than BE². EA.

"If it is greater, no synthesis is possible, as was shown in the analysis; if it is equal, the point E satisfies the conditions of the problem. For in equal solids the bases are inversely proportional to the altitudes, and $EA: A\Gamma = \Delta: B\dot{E}^2$.

"If Δ . A Γ is less than BE². EA, the synthesis is thus accomplished: let A Γ be placed at right angles to AB, and through Γ let Γ Z be drawn parallel to

a stationary value when $3ax - 3x^2 = 0$, *i.e.*, when x = 0 (which gives a minimum value) or $x = \frac{\pi}{3}a$ (which gives a maximum). No such easy course was open to Archimedes.

· Figure on p. 146.

b Sc. " not greater than BE2. EA when BE = 2EA."

άλληλος ηχθω η ΓΖ, διὰ δὲ τοῦ Β τη ΑΓ παράλληλος ήχθω ή BZ καὶ συμπιπτέτω τῆ ΓΕ ἐκβληθείση κατὰ τὸ Η, καὶ συμπεπληρώσθω τὸ $m Z\Theta$ παραλληλόγραμμον, καὶ διὰ το $m \widetilde{E}$ $m au \widehat{\eta}$ m ZHπαράλληλος ήχθω ή ΚΕΛ. ἐπεὶ οὖν τὸ Δ ἐπὶ την ΑΓ έλασσόν έστι τοῦ ἀπὸ ΒΕ ἐπὶ την ΕΑ, ἔστιν, ώς ή ΕΑ πρὸς ΑΓ, οὕτως τὸ Δ πρὸς ἔλασσόν τι τοῦ ἀπὸ τῆς ΒΕ, τουτέστι τοῦ ἀπὸ τῆς ΗΚ. έστω οὖν, ώς ή ΕΑ πρὸς ΑΓ, οὕτως τὸ Δ πρὸς τὸ ἀπὸ ΗΜ, καὶ τῶ Δ ἴσον ἔστω τὸ ὑπὸ ΓΖΝ. ἐπεὶ οὖν ἐστιν, ώς ἡ ΕΑ πρὸς ΑΓ, οὕτως τὸ Δ, τουτέστι τὸ ὑπὸ ΓΖΝ, πρὸς τὸ ἀπὸ ΗΜ, ἀλλ' ὡς ή ΕΑ πρὸς ΑΓ, οὕτως ή ΓΖ πρὸς ΖΗ, ώς δὲ ή ΓΖ πρὸς ΖΗ, οὕτως τὸ ἀπὸ ΓΖ πρὸς τὸ ὑπὸ ΓΖΗ, καὶ ώς ἄρα τὸ ἀπὸ ΓΖ πρὸς τὸ ὑπὸ ΓΖΗ, ούτως τὸ ὑπὸ ΓΖΝ πρὸς τὸ ἀπὸ ΗΜ· καὶ ἐναλλάξ. ώς τὸ ἀπὸ ΓΖ πρὸς τὸ ὑπὸ ΓΖΝ, οὕτως τὸ ὑπὸ ΓΖΗ πρὸς τὸ ἀπὸ ΗΜ. ἀλλ' ὡς τὸ ἀπὸ ΓΖ πρὸς τὸ ὑπὸ ΓΖΝ, ἡ ΓΖ πρὸς ΖΝ, ὡς δὲ ἡ ΓΖ πρὸς ΖΝ, τῆς ΖΗ κοινοῦ ὕψους λαμβανομένης ούτως τὸ ὑπὸ ΓΖΗ πρὸς τὸ ὑπὸ ΝΖΗ καὶ ὡς ἄρα τὸ ὑπὸ ΓΖΗ πρὸς τὸ ὑπὸ ΝΖΗ, οὕτως τὸ ὑπὸ ΓΖΗ πρὸς τὸ ἀπὸ ΗΜ. ἴσον ἄρα ἐστὶ τὸ ἀπὸ ΗΜ τῶ ὑπὸ ΗΖΝ.

'' 'Εὰν ἄρα διὰ τοῦ Ζ περὶ ἄξονα τὴν ΖΗ γράψωμεν παραβολήν, ωστε τὰς καταγομένας δύνασθαι παρὰ τὴν ΖΝ, ηξει διὰ τοῦ Μ. γεγράφθω, καὶ έστω ώς ή ΜΞΖ. καὶ ἐπεὶ ἴσον ἐστὶ τὸ ΘΛ τῶ ΑΖ, τουτέστι τὸ ὑπὸ ΘΚΛ τῷ ὑπὸ ΑΒΖ, ἐὰν διὰ 144

AB, and through B let BZ be drawn parallel to A Γ , and let it meet Γ E produced at H, and let the parallelogram $Z\Theta$ be completed, and through E let KEA be drawn parallel to ZH. Now

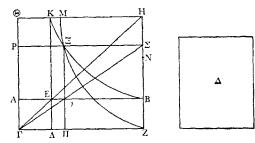

since	Δ . A Γ	$<$ BE 2 . EA,
··.	$EA:A\Gamma$	 = Δ: (the square of some quantity less than BE) = Δ: (the square of some quantity less than HK).
Let	$EA:A\Gamma$	$=\Delta:\mathrm{HM}^2,$
and let	7	$=\Gamma Z \cdot ZN.$
Then	$EA:A\Gamma$	$=\Delta: HM^2$
		$=\Gamma Z \cdot ZN : HM^2$.
But	$\mathbf{E}\mathbf{A}:\mathbf{A}\Gamma$	$=\Gamma Z:ZH$,
and	$\Gamma Z:ZH$	$=\Gamma Z^2:\Gamma Z\cdot ZH$;
<i>:</i> .	$\Gamma Z^2 : \Gamma Z . ZH$	$=\Gamma Z \cdot ZN : HM^2;$
and permutando,	$\Gamma Z^2 : \Gamma Z \cdot Z N$	$= I'Z \cdot ZH : HM^2$.
But	$\Gamma Z^2 : \Gamma Z \cdot Z N$	$=\Gamma Z:ZN,$
and	$\Gamma Z: ZN$	$=\Gamma Z \cdot ZH : NZ \cdot ZH$,
by taking a common altitude ZH;		
and \therefore $\Gamma Z \cdot ZH : NZ \cdot ZH = \Gamma Z \cdot ZH : HM2;$		
$\therefore \qquad \qquad HM^2 = HZ.ZN.$

"Therefore if we describe through Z a parabola about the axis ZH and with parameter ZN, it will pass through M. Let it be described, and let it be as $M\Xi Z$. Then since

$$\Theta \Lambda = AZ$$
, [Eucl. i. 43]

i.e. $\Theta K \cdot KA = AB \cdot BZ$, vol. II L 145

τοῦ Β περὶ ἀσυμπτώτους τὰς ΘΓ, ΓΖ γράψωμεν ὑπερβολήν, ήξει διὰ τοῦ Κ διὰ τὴν ἀντιστροφὴν

τοῦ η' θεωρήματος τῶν ᾿Απολλωνίου Κωνικῶν στοιχείων. γεγράφθω, καὶ ἔστω ώς ή ΒΚ τέμνουσα την παραβολην κατά τὸ Ξ, καὶ ἀπὸ τοῦ Ξ έπὶ τὴν ΑΒ κάθετος ἤχθω ἡ ΞΟΠ, καὶ διὰ τοῦ Ε τη ΑΒ παράλληλος ήχθω ή ΡΕΣ. ἐπεὶ οῦν ύπερβολή έστιν ή ΒΞΚ, ἀσύμπτωτοι δὲ αί ΘΓ, ΓΖ, καὶ παράλληλοι ηγμέναι εἰσὶν αἱ ΡΞΠ ταῖς ΑΒΖ, ἴσον ἐστὶ τὸ ὑπὸ ΡΞΠ τῶ ὑπὸ ΑΒΖ. ὥστε καὶ τὸ ΡΟ τῶ ΟΖ. ἐὰν ἄρα ἀπὸ τοῦ Γ ἐπὶ τὸ Σ ἐπιζευχθ $\hat{\eta}$ εὐθεῖα, ἥξει διὰ τοῦ O. ἐρχέσθω, καὶ ἔστω ώς ἡ $FO\Sigma$. ἐπεὶ οὖν ἐστιν, ώς ἡ OAπρός ΑΓ, ούτως ή ΟΒ πρός ΒΣ, τουτέστιν ή ΓΖ πρὸς $Z\Sigma$, ώς δὲ ἡ ΓZ πρὸς $Z\Sigma$, $\tau η S$ ZN κοινοῦ ύψους λαμβανομένης ούτως τὸ ὑπὸ ΓΖΝ πρὸς τὸ ὑπὸ ΣΖΝ, καὶ ὡς ἄρα ἡ ΟΑ πρὸς ΑΓ, οὕτως τὸ ὑπὸ ΓΖΝ πρὸς τὸ ὑπὸ ΣΖΝ. καί ἐστι τῷ μεν ύπο ΓΖΝ ἴσον το Δ χωρίον, τῶ δε ὑπο ΣΖΝ ίσον τὸ ἀπὸ ΣΞ, τουτέστι τὸ ἀπὸ ΒΟ, διὰ τὴν παραβολήν ώς ἄρα ή ΟΑ πρὸς ΑΓ, οὕτως τὸ Δ 146

if we describe through B a hyperbola in the asymptotes $\Theta\Gamma$, ΓZ , it will pass through K by the converse of the eighth theorem [of the second book] of Apollonius's *Elements of Conics*. Let it be described, and let it be as BK cutting the parabola in Ξ , and from Ξ let Ξ OII be drawn perpendicular to AB, and through Ξ let $P\Xi\Sigma$ be drawn parallel to AB. Then since $B\Xi$ K is a hyperbola and $\Theta\Gamma$, ΓZ are its asymptotes, while $P\Xi$, $\Xi\Pi$ are parallel to AB, BZ,

$$P\Xi \cdot \Xi II = AB \cdot BZ$$
; [Apoll. ii. 12
 $PO = OZ$.

Therefore if a straight line be drawn from Γ to Σ it will pass through O [Eucl. i. 48, converse]. Let it be drawn, and let it be as Γ O Σ . Then since

$$OA : A\Gamma = OB : B\Sigma$$
 [Eucl. vi. 4]
= $\Gamma Z : Z\Sigma$,

and $\Gamma Z : Z \Sigma = \Gamma Z \cdot Z N : \Sigma Z \cdot Z N$,

by taking a common altitude ZN,

٠.

$$\cdot \cdot \cdot$$
 OA: A $\Gamma = \Gamma Z \cdot ZN : \Sigma Z \cdot ZN$.

And $\Gamma Z \cdot ZN = \Delta$, $\Sigma Z \cdot ZN = \Sigma \Xi^2 = BO^2$, by the property of the parabola [Apoll. i. 11].

$$OA:A\Gamma=\Delta:BO^2$$
;

χωρίον πρός τὸ ἀπὸ τῆς ΒΟ. εἴληπται ἄρα τὸ Ο σημεῖον ποιοῦν τὸ πρόβλημα.

""Ότι δὲ διπλασίας οὔσης τῆς ΒΕ τῆς ΕΑ τὸ ἀπὸ τῆς ΒΕ ἐπὶ τὴν ΕΑ μέγιστόν ἐστι πάντων τῶν ὁμοίως λαμβανομένων ἐπὶ τῆς ΒΑ, δειχθήσεται οὔτως. ἔστω γάρ, ὡς ἐν τῆ ἀναλύσει, πάλιν δοθεῖσα εὐθεῖα πρὸς ὀρθὰς τῆ ΑΒ ἡ ΑΓ, καὶ ἐπι-ζευχθεῖσα ἡ ΓΕ ἐκβεβλήσθω καὶ συμπιπτέτω τῆ διὰ τοῦ Β παραλλήλω ἠγμένη τῆ ΑΓ κατὰ τὸ Ζ, καὶ διὰ τῶν Γ, Ζ παράλληλοι τῆ ΑΒ ἤχθωσαν αἱ ΘΖ, ΓΗ, καὶ ἐκβεβλήσθω ἡ ΓΑ ἐπὶ τὸ Θ, καὶ ταύτη παράλληλος διὰ τοῦ Ε ἤχθω ἡ ΚΕΛ, καὶ γεγονέτω, ὡς ἡ ΕΑ πρὸς ΑΓ, οὕτως τὸ ὑπὸ ΓΗΜ πρὸς τὸ ἀπὸ ΕΒ· τὸ ἄρα ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ ἴσον ἐστὶ τῷ ὑπὸ ΓΗΜ ἐπὶ τὴν ΑΓ διὰ τὸ δυὸ στερεῶν ἀντιπεπονθέναι τὰς βάσεις τοῖς ὕψεσιν. λέγω οὖν, ὅτι τὸ ὑπὸ ΓΗΜ ἐπὶ τὴν ΑΓ μέγιστόν ἐστι πάντων τῶν ὁμοίως ἐπὶ τῆς ΒΑ λαμβανομένων.

"Γεγράφθω γὰρ διὰ τοῦ Η περὶ ἄξονα τὴν ΖΗ παραβολή, ὅστε τὰς καταγομένας δύνασθαι παρὰ τὴν ΗΜ ήξει δὴ διὰ τοῦ Κ, ὡς ἐν τῷ ἀναλύσει δέδεικται, καὶ συμπεσεῖται ἐκβαλλομένη τῷ ΘΓ παραλλήλω οὐση τῷ διαμέτρω τῆς τομῆς διὰ τὸ ἔβδομον καὶ εἰκοστὸν θεώρημα τοῦ πρώτου βιβλίου τῶν ᾿Απολλωνίου Κωνικῶν στοιχείων. ἐκβεβλήσθω καὶ συμπιπτέτω κατὰ τὸ Ν, καὶ διὰ τοῦ Β περὶ ἀσυμπτώτους τὰς ΝΓΗ γεγράφθω ὑπερβολή ἤξει ἄρα διὰ τοῦ Κ, ὡς ἐν τῷ ἀναλύσει εἴρηται. ἐρχέσθω οὖν ὡς ἡ ΒΚ, καὶ ἐκβληθείση τῷ ΖΗ ἴση κείσθω ἡ ΗΞ, καὶ ἐπεζεύχθω ἡ ΞΚ

148

therefore the point O has been found satisfying the conditions of the problem.

"That BE². EA is the greatest of all the figures similarly taken upon BA when BE=2EA will be thus proved. Let there again be, as in the analysis, a given straight line A Γ at right angles to AB, and let Γ E be joined and let it, when produced, meet at Z the line through B drawn parallel to A Γ , and through Γ , Z let Θ Z, Γ H be drawn parallel to AB, and let Γ A be produced to Θ , and through E let KEA be drawn parallel to it, and let

 $EA:A\Gamma = \Gamma H \cdot HM : EB^2$;

then

 $BE^2 \cdot EA = (\Gamma H \cdot HM) \cdot A\Gamma$,

owing to the fact that in two [equal] solids the bases are inversely proportional to the altitudes. I assert, then, that $(\Gamma H \cdot HM) \cdot A\Gamma$ is the greatest of all the

figures similarly taken upon BA.

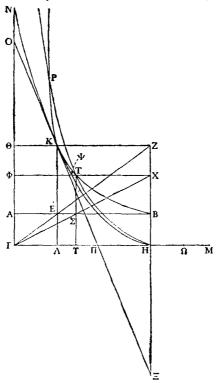

"For let there be described through H a parabola about the axis ZH and with parameter HM; it will pass through K, as was proved in the analysis, and, if produced, it will meet $\Theta\Gamma$, being parallel to the axis b of the parabola, by the twenty-seventh theorem of the first book of Apollonius's Elements of Conics. Let it be produced, and let it meet at N, and through B let a hyperbola be drawn in the asymptotes NT, Γ H; it will pass through K, as was shown in the analysis. Let it be described as BK, and let ZH be produced to Ξ so that ZH = H Ξ , and let Ξ K be joined

^a Figure on p. 151.

[•] In the same notation as before, the condition BE². EA= $(\Gamma H. HM)$. A Γ is $\frac{4}{27}a^3=bc^2$; and Archimedes has proved that, when this condition holds, the parabola $x^2=\frac{a^2}{a}y$ touches the hyperbola (a-x)y=ab at the point $\left(\frac{2}{3}a,3b\right)$ because they both touch at this point the same straight line, that is the 152

OOK is similar to the triangle ΞZK , so that $\Xi K = 2KO$. But $\Xi K = 2K\Pi$ because $\Xi Z = 2\Xi H$ and ΠH is parallel to KZ; therefore $OK = K\Pi$. Therefore $OK\Pi$, which meets the hyperbola and lies between the asymptotes, is bisected; therefore, by the converse of the third theorem of the second book of Apollonius's *Elements of Conics*, it is a tangent to the hyperbola. But it touches the parabola at the same point K. Therefore the parabola touches the hyperbola at K.

"Let the hyperbola be therefore conceived as produced to P, and upon AB let any point Σ be taken, and through Σ let $T\Sigma Y$ be drawn parallel to $K\Lambda$ and let it meet the hyperbola at T, and through T let ΦTX be drawn parallel to ΓH . Now by virtue of the property of the hyperbola and its asymptotes, $\Phi Y = \Gamma B$, and, the common element $\Gamma \Sigma$ being subtracted, $\Phi \Sigma = \Sigma H$, and therefore the straight line drawn from Γ to X will pass through Σ [Eucl. i. 43, conv.]. Let it be drawn, and let it be as $\Gamma \Sigma X$. Then since, in virtue of the property of the parabola,

 $\Psi X^2 = XH \cdot HM$, [Apoll. i. 11]

line 9bx - ay - 3ab = 0, as may easily be shown. We may prove this fact in the following simple manner. Their points of intersection are given by the equation

$$x^2(a-x) = bc^2,$$

which may be written

$$x^3 - ax^2 + \frac{4}{27}a^3 = \frac{4}{27}a^3 - bc^2,$$
 or
$$\left(x - \frac{9}{3}a\right)^2 \left(x + \frac{a}{3}\right) = \frac{4}{27}a^3 - bc^2.$$

Therefore, when $bc^2 = \frac{4}{27}a^3$ there are two coincident solu-

tions, $x = \frac{2}{3}a$, lying between 0 and a, and a third solution

$$x = -\frac{a}{2}$$
, outside that range.

έστι τοῦ ὑπὸ ΧΗΜ. γεγονέτω οὖν τῷ ἀπὸ ΤΧ ἴσον τὸ ὑπὸ ΧΗΩ. ἐπεὶ οὖν ἐστιν, ὡς ἡ ΣΑ πρὸς ΑΓ, οὕτως ἡ ΓΗ πρὸς ΗΧ, ἀλλ' ὡς ἡ ΓΗ πρὸς ΗΧ, τῆς ΗΩ κοινοῦ ὕψους λαμβανομένης οὕτως τὸ ὑπὸ ΓΗΩ πρὸς τὸ ὑπὸ ΧΗΩ καὶ πρὸς τὸ ἴσον αὐτῷ τὸ ἀπὸ ΧΤ, τουτέστι τὸ ἀπὸ ΒΣ, τὸ ἄρα ἀπὸ ΒΣ ἐπὶ τὴν ΣΑ ἴσον ἐστὶ τῷ ὑπὸ ΓΗΩ ἐπὶ τὴν ΓΑ. τὸ δὲ ὑπὸ ΓΗΩ ἐπὶ τὴν ΓΑ ἔλασσόν ἐστι τοῦ ὑπὸ ΓΗΜ ἐπὶ τὴν ΓΑ τὸ ἄρα ἀπὸ ΒΣ ἐπὶ τὴν ΣΑ ἔλαττόν ἐστι τοῦ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ. ὁμοίως δὴ δειχθήσεται καὶ ἐπὶ πάντων τῶν σημείων τῶν μεταξὺ λαμβανομένων τῶν Ε, Β.

<XH . HM. TX^2 ٠. Let TX^2 $=XH \cdot H\Omega$. Then since $\Sigma A : A\Gamma = \Gamma H : HX$. while $\Gamma H : HX = \Gamma H . H\Omega : XH . H\Omega$ by taking a common altitude $H\Omega$, $= \Gamma H \cdot H\Omega : XT^2$ $= \Gamma H \cdot H\Omega : B\Sigma^2$ $B\Sigma^2$. $\Sigma A = (\Gamma H \cdot H\Omega) \cdot \Gamma A$. ٠.

 $(\Gamma H \cdot H\Omega) \cdot \Gamma A < (\Gamma H \cdot HM) \cdot \Gamma A$;

 $B\Sigma^2$, $\Sigma A < BE^2$, EA, ٠.

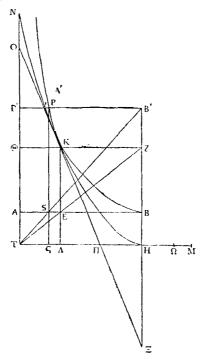

This can be proved similarly for all points taken between E. B.

"Now let there be taken a point & between E, A. I assert that in this case also BE^2 . EA>B ϵ . ϵ A.

"With the same construction, let SSP be drawn a through ς parallel to $K\Lambda$ and let it meet the hyperbola at P; it will meet the hyperbola because it is parallel to an asymptote [Apoll. ii. 13]; and through P let A'PB' be drawn parallel to AB and let it meet HZ produced in B'. Since, in virtue of the property of the hyperbola, $\Gamma' \varsigma = AH$, the straight line drawn from Γ to B' will pass through ε [Eucl. i. 43, conv.]. Let it be drawn and let it be as I's B'. Again, since, in virtue of the property of the parabola,

A'B'2 $= B'H \cdot HM$. PB'2 <B'H . HM. ٠. Let $PB'^2 = B'H \cdot H\Omega$ Then since $\mathcal{L}A : A\Gamma = \Gamma H : HB'$. while $\Gamma H : HB' = \Gamma H . H\Omega : B'H . H\Omega$.

ΗΩ κοινοῦ ὕψους λαμβανομένης οὕτως τὸ ὑπὸ ΓΗΩ πρὸς τὸ ὑπὸ Β΄ΗΩ, τουτέστι πρὸς τὸ ἀπὸ

PB΄, τουτέστι πρὸς τὸ ἀπὸ B̄ς, τὸ ἄρα ἀπὸ B̄ς ἐπὶ τὴν ς Α ἴσον ἐστὶ τῷ ὑπὸ ΓΗΩ ἐπὶ τὴν ΓΑ. καὶ μεῖζον τὸ ὑπὸ ΓΗΜ τοῦ ὑπὸ ΓΗΩ· μεῖζον ἄρα καὶ τὸ ἀπὸ B̄ς ἐπὶ τὴν ΕΑ τοῦ ἀπὸ B̄ς ἐπὶ 156

by taking a common altitude $H\Omega$,

 $=\Gamma H$, $H\Omega: PB'^2$

= $\Gamma H \cdot H\Omega : B \in \mathbb{Z}$,

 $BS^{2}.SA = (\Gamma H.H\Omega).\Gamma A.$

And $\Gamma H \cdot IIM > \Gamma H \cdot H\Omega$;

 $\therefore BE^2 \cdot EA > B\varsigma^2 \cdot \varsigma A.$

τὴν ε A. ὁμοίως δὴ δειχθήσεται καὶ ἐπὶ πάντων τῶν σημείων τῶν μεταξὺ τῶν Ε, Α λαμβανομένων. ἐδείχθη δὲ καὶ ἐπὶ πάντων τῶν μεταξὺ τῶν Ε, Β· πάντων ἄρα τῶν ἐπὶ τῆς AB ὁμοίως λαμβανομένων μέγιστόν ἐστιν τὸ ἀπὸ τῆς BE ἐπὶ τὴν EA, ὅταν ἢ διπλασία ἡ BE τῆς ΕΑ."

Ἐπιστῆσαι δὲ χρὴ καὶ τοῖς ἀκολουθοῦσιν κατὰ τὴν εἰρημένην καταγραφήν. ἐπεὶ γὰρ δέδεικται τὸ ἀπὸ ΒΣ ἐπὶ τὴν ΣΑ καὶ τὸ ἀπὸ Βς ἐπὶ τὴν ς Α ἔλασσον τοῦ ἀπὸ ΒΕ ἐπὶ τὴν ΕΑ, δυνατόν ἐστι καὶ τοῦ δοθέντος χωρίου ἐπὶ τὴν δοθεῖσαν ἐλάσσονος ὄντος τοῦ ἀπὸ τῆς ΒΕ ἐπὶ τὴν ΕΑ κατὰ δύο σημεῖα τὴν ΑΒ τεμνομένην ποιεῖν τὸ ἐξ ἀρχῆς πρόβλημα. τοῦτο δὲ γίνεται, εἰ νοήσαιμεν περὶ διάμετρον τὴν ΧΗ γραφομένην παραβολήν, ὥστε τὰς καταγομένας δύνασθαι παρὰ τὴν ΗΩ· ἡ γὰρ τοιαύτη παραβολὴ πάντως ἔρχεται διὰ τοῦ Τ. καὶ ἐπειδὴ ἀνάγκη αὐτὴν συμπίπτειν τῷ ΓΝ παραλλήλω οὖση τῷ διαμέτρω, δῆλον, ὅτι τέμνει τὴν ὑπερβολὴν καὶ κατ᾽ ἄλλο σημεῖον ἀνωτέρω τοῦ Κ, ὡς ἐνταῦθα κατὰ τὸ Ρ, καὶ ἀπὸ τοῦ Ρ ἐπὶ τὴν ΑΒ κάθετος ἀγομένη, ὡς ἐνταῦθα ἡ Ρς, τέμνει τὴν ΑΒ κατὰ τὸ ς, ὥστε τὸ ς σημεῖον ποιεῖν τὸ πρό-

^b In the mss. the figures on pp. 150 and 156 are com-158

^a There is some uncertainty where the quotation from Archimedes ends and Eutocius's comments are resumed. Heiberg, with some reason, makes Eutocius resume his comments at this point.

This can be proved similarly for all points taken between E, A. And it was proved for all points between E, B; therefore for all figures similarly taken upon AB, BE^2 . EA is greatest when BE=2EA."

The following consequences a should also be noticed in the aforementioned figure. Inasmuch as it has been proved that

 $B\Sigma^2 \cdot \Sigma A < BE^2$.

and

 $Bs^{-2} \cdot sA < BE^2 \cdot EA$

if the product of the given space and the given straight line is less than BE^2 . EA, it is possible to cut AB in two points satisfying the conditions of the original problem. This comes about if we conceive a parabola described about the axis XH with parameter $H\Omega$; for such a parabola will necessarily pass through T^d . And since it must necessarily meet ΓN , being parallel to a diameter [Apoll. Con. i. 26], it is clear that it cuts the hyperbola in another point above K, as at P in this case, and a perpendicular drawn from P to AB, as P^c in this case, will cut AB in C^c , so that the point C^c satisfies the conditions of the

bined; in this edition it is convenient, for the sake of clarity, to give separate figures.

With the same notation as before this may be stated: when $bc^2 < \frac{4}{27}a^3$, there are always two real solutions of the cubic equation $x^2(a-x) = bc^2$ lying between 0 and a. If the cubic has two real roots it must, of course, have a third real root as well, but the Greeks did not recognize negative solutions.

^d By Apoll. i. 11, since $TX^2 = XH \cdot H\Omega$.

βλημα, καὶ ἴσον γίνεσθαι τὸ ἀπὸ ΒΣ ἐπὶ τὴν ΣΑ τῷ ἀπὸ Βς ἐπὶ τὴν ς Α, ὥς ἐστι διὰ τῶν προειρημένων ἀποδείξεων ἐμφανές. ὥστε δυνατοῦ ὅντος ἐπὶ τῆς ΒΑ δύο σημεῖα λαμβάνειν ποιοῦντα τὸ ζητούμενον, ἔξεστιν, ὁπότερόν τις βούλοιτο, λαμβάνειν ἢ τὸ μεταξὺ τῶν Ε, Β ἢ τὸ μεταξὺ τῶν Ε, Α. εἰ μὲν γὰρ τὸ μεταξὺ τῶν Ε, Β, ὡς εἴρηται, τῆς διὰ τῶν Η, Τ σημείων γραφομένης παραβολῆς κατὰ δύο σημεῖα τεμνούσης τὴν ὑπερβολὴν τὸ μὲν ἐγγύτερον τοῦ Η, τουτέστι τοῦ ἄξονος τῆς παραβολῆς, εὐρήσει τὸ μεταξὺ τῶν Ε, Β, ὡς ἐνταῦθα τὸ Τ εὐρίσκει τὸ Σ, τὸ δὲ ἀπωτέρω τὸ μεταξὺ τῶν Ε, Α, ὡς ἐνταῦθα τὸ Ρ εὐρίσκει τὸ ς.

Καθόλου μὲν οὖν οὖτως ἀναλέλυται καὶ συντέθειται τὸ πρόβλημα· ἴνα δὲ καὶ τοῖς ᾿Αρχιμηδείοις ρήμασιν ἐφαρμοσθῆ, νενοήσθω ὡς ἐν αὐτῆ τῆ τοῦ ρητοῦ καταγραφῆ διάμετρος μὲν τῆς σφαίρας ἡ ΔΒ, ἡ δὲ ἐκ τοῦ κέντρου ἡ ΒΖ, καὶ ἡ δεδομένη ἡ ΖΘ. κατηντήσαμεν ἄρα, φησίν, εἰς τὸ "τὴν ΔΖ τεμεῖν κατὰ τὸ Χ, ὥστε εἶναι, ὡς τὴν ΧΖ πρὸς τὴν δοθεῖσαν, οὕτως τὸ δοθὲν πρὸς τὸ ἀπὸ τῆς ΔΧ. τοῦτο δὲ ἀπλῶς μὲν λεγόμενον ἔχει διορισμόν." εἰ γὰρ τὸ δοθὲν ἐπὶ τὴν δοθεῖσαν μεῖζον ἐτύγχανεν τοῦ ἀπὸ τῆς ΔΒ ἐπὶ τὴν ΒΖ, ἀδύνατον ἦν τὸ πρόβλημα, ὡς δέδεικται, εἰ δὲ ἴσον, τὸ Β σημεῖον ἐποίει τὸ πρόβλημα, καὶ οὕτως δὲ οὐδὲν ἦν πρὸς τὴν ἐξ ἀρχῆς ᾿Αρχιμήδους πρόθεσιν· ἡ γὰρ σφαῖρα οὐκ ἐτέμνετο εἰς τὸν δοθέντα

b v. supra, p. 133.

^a Archimedes' figure is re-drawn (v. page 162) so that B, Z come on the left of the figure and Δ on the right; instead of B, Z on the right and Δ on the left.

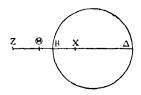

problem, and $B\Sigma^2 \cdot \Sigma A = B_{\sigma^2} \cdot SA$, as is clear from the above proof. Inasmuch as it is possible to take on BA two points satisfying what is sought, it is permissible to take whichever one wills, either the point between E, B or that between E, A. If we choose the point between E, B, the parabola described through the points H, T will, as stated, cut the hyperbola in two points; of these the one nearer to H, that is to the axis of the parabola, will determine the point between E, B, as in this case T determines Σ , while the point farther away will determine the point between E, A, as in this case P determines S.

The analysis and synthesis of the general problem have thus been completed; but in order that it may be harmonized with Archimedes' words, let there be conceived, as in Archimedes' own figure, a a diameter ΔB of the sphere, with radius [equal to] BZ. and a given straight line ZO. We are therefore faced with the problem, he says, "so to cut ΔZ at X that XZ bears to the given straight line the same ratio as the given area bears to the square on ΔX . When the problem is stated in this general form, it is necessary to investigate the limits of possibility." b If therefore the product of the given area and the given straight line chanced to be greater than ΔB^2 . BZ, the problem would not admit a solution. as was proved, and if it were equal the point B would satisfy the conditions of the problem, which also would be of no avail for the purpose Archimedes set himself at the outset; for the sphere would not be

vol. 11 M 161

^c For $\Delta B = \frac{2}{3}\Delta Z$ [ex hyp.], and so ΔB in the figure on p. 162 corresponds with BE in the figure on p. 146, while BZ in the figure on p. 163 corresponds with EA in the figure on p. 146.

λόγον. ἀπλῶς ἄρα λεγόμενον εἶχεν προσδιορισμόν· " προυτιθεμένων δὲ τῶν προβλημάτων τῶν ἐνθάδε

ύπαρχόντων," τουτέστι τοῦ τε διπλασίαν εἶναι τὴν ΔΒ τῆς ΖΒ καὶ τοῦ μείζονα εἶναι τὴν ΒΖ τῆς ΖΘ, " οὐκ ἔχει διορισμόν." τὸ γὰρ ἀπὸ ΔΒ τὸ δοθὲν ἐπὶ τὴν ΖΘ τὴν δοθεῖσαν ἔλαττόν ἐστι τοῦ ἀπὸ τῆς ΔΒ ἐπὶ τὴν ΒΖ διὰ τὸ τὴν ΒΖ τῆς ΖΘ μείζονα εἶναι, οὖπερ ὑπάρχοντος ἐδείξαμεν δυνατόν, καὶ ὅπως προβαίνει τὸ πρόβλημα.

^a Eutocius proceeds to give solutions of the problem by Diony sodorus and Diocles, by whose time, as he has explained, Archimedes' own solution had already disappeared. Dionysodorus solves the less general equation by means of the intersection of a parabola and a rectangular hyperbola; Diocles solves the general problem by the intersection of an ellipse with a rectangular hyperbola, and his proof is both ingenious and intricate. Details may be consulted in Heath, H.G.M. ii. 46-49 and more fully in Heath, 162

cut in the given ratio. Therefore when the problem was stated generally, an investigation of the limits of possibility was necessary as well; "but under the conditions of the present case," that is, if $\Delta B = 2ZB$ and $BZ > Z\theta$, "no such investigation is necessary." For the product of the given area ΔB^2 into the given straight line $Z\theta$ is less than the product of ΔB^2 into BZ by reason of the fact that BZ is greater than $Z\theta$, and we have shown that in this case there is a solution, and how it can be effected.

The Works of Archimedes, pp. exxiii-exli, which deals with the whole subject of cubic equations in Greek mathematical history. It is there pointed out that the problem of finding mean proportionals is equivalent to the solution of a pure cubic equation, $\frac{a^3}{a^3} = \frac{a}{b}$, and that Menaechmus's solution, by the intersection of two conic sections (v. vol. i. pp. 278-283). is the precursor of the method adopted by Archimedes, Dionysodorus and Diocles. The solution of cubic equations by means of conics was, no doubt, found easier than a solution by the manipulation of parallelepipeds, which would have been analogous to the solution of quadratic equations by the application of areas (v. vol. i. pp. 186-215). No other examples of the solution of cubic equations have survived. but in his preface to the book On Conoids and Spheroids Archimedes says the results there obtained can be used to solve other problems, including the following, "from a given spheroidal figure or conoid to cut off, by a plane drawn parallel to a given plane, a segment which shall be equal to a given cone or cylinder, or to a given sphere" (Archim. ed. Heiberg i. 258. 11-15); the case of the paraboloid of revolu-tion does not lead to a cubic equation, but those of the spheroid and hyperboloid of revolution do lead to cubics. which Archimedes may be presumed to have solved. The conclusion reached by Heath is that Archimedes solved completely, so far as the real roots are concerned, a cubic equation in which the term in x is absent: and as all cubic equations can be reduced to this form, he may be regarded as having solved geometrically the general cubic.

(d) Conoids and Spheroids

(i.) Preface

Archim. De Con. et Sphaer., Praef., Archim. ed. Heiberg i. 246, 1-14

Αρχιμήδης Δοσιθέω εὖ πράττειν.

'Αποστέλλω τοι γράψας ἐν τῷδε τῷ βιβλίῳ τῶν τε λοιπῶν θεωρημάτων τὰς ἀποδείξιας, ὧν οὐκ εἶχες ἐν τοῖς πρότερον ἀπεσταλμένοις, καὶ ἄλλων ὕστερον ποτεξευρημένων, ἃ πρότερον μὲν ἤδη πολλάκις ἐγχειρήσας ἐπισκέπτεσθαι δύσκολον ἔχειν τι φανείσας μοι τᾶς εὐρέσιος αὐτῶν ἀπόρησα· διόπερ οὐδὲ συνεξεδόθεν τοῖς ἄλλοις αὐτῶν ἀπόρησα· διέπερον οὐδὲ συνεξεδόθεν τοῖς ἄλλοις αὐτὰ τὰ προβεβλημένα. ὕστερον δὲ ἐπιμελέστερον ποτ' αὐτοῖς γενόμενος ἐξεῦρον τὰ ἀπορηθέντα. ἦν δὲ τὰ μὲν λοιπὰ τῶν προτέρων θεωρημάτων περὶ τοῦ ὀρθογωνίου κωνοειδέος προβεβλημένα, τὰ δὲ νῦν ἐντι ποτεξευρημένα περί τε ἀμβλυγωνίου κωνοειδέος καὶ περὶ σφαιροειδέων σχημάτων, ὧν τὰ μὲν παραμάκεα, τὰ δὲ ἐπιπλατέα καλέω.

(d) Conoids and Spheroids

(i.) Preface

Archimedes, On Conoids and Spheroids, Preface, Archim. ed. Heiberg i. 246. 1-14

Archimedes to Dositheus greeting.

I have written out and now send you in this book the proofs of the remaining theorems, which you did not have among those sent to you before, and also of some others discovered later, which I had often tried to investigate previously but their discovery was attended with some difficulty and I was at a loss over them; and for this reason not even the propositions themselves were forwarded with the rest. But later, when I had studied them more carefully, I discovered what had left me at a loss before. Now the remainder of the earlier theorems were propositions about the right-angled conoid b; but the discoveries now added relate to an obtuse-angled conoid and to spheroidal figures, of which I call some oblong and others flat.

(ii.) Two Lemmas

Ibid., Lemma to Prop. 1, Archim. ed. Heiberg i. 260, 17-24

If there be a series of magnitudes, as many as you please, in which each term exceeds the previous term by an

ellipse about its major axis, a *flat spheroid* by the revolution of an ellipse about its minor axis.

In the remainder of our preface Archimedes gives a number of definitions connected with those solids. They are of importance in studying the development of Greek mathematical terminology.

ύπερέχοντα, ἢ δὲ ά ὑπεροχὰ ἴσα τῷ ἐλαχίστῳ, καὶ ἄλλα μεγέθεα τῷ μὲν πλήθει ἴσα τούτοις, τῷ δὲ μεγέθει ἔκαστον ἴσον τῷ μεγίστῳ, πάντα τὰ μεγέθεα, ὧν ἐστιν ἔκαστον ἴσον τῷ μεγίστῳ, πάντων μὲν τῶν τῷ ἴσῳ ὑπερεχόντων ἐλάσσονα ἐσσοῦνται ἢ διπλάσια, τῶν δὲ λοιπῶν χωρὶς τοῦ μεγίστου μείζονα ἢ διπλάσια. ά δὲ ἀπόδειξις τούτου φανερά.

Ibid., Prop. 1, Archim. ed. Heiberg i. 260, 26-261, 22

Εἴ κα μεγέθεα ὁποσαοῦν τῷ πλήθει ἄλλοις μεγέθεσιν ἴσοις τῷ πλήθει κατὰ δύο τὸν αὐτὸν λόγον ἔχωντι τὰ ὁμοίως τεταγμένα, λέγηται δὲ τά τε πρῶτα μεγέθεα ποτ' ἄλλα μεγέθεα ἢ πάντα ἤ τινα αὐτῶν ἐν λόγοις ὁποιοισοῦν, καὶ τὰ ὕστερον ποτ' ἄλλα μεγέθεα τὰ ὁμόλογα ἐν τοῖς αὐτοῖς λόγοις, πάντα τὰ πρῶτα μεγέθεα ποτὶ πάντα, ἃ λέγονται, τὸν αὐτὸν ἑξοῦντι λόγον, ὃν ἔχοντι πάντα τὰ ὕστερον μεγέθεα ποτὶ πάντα, ἃ λέγονται.

Έστω τινὰ μεγέθεα τὰ Α, Β, Γ, Δ, Ε, Ζ ἄλλοις μεγέθεσιν ἴσοις τῷ πλήθει τοῖς, Η, Θ, Ι, Κ, Λ, Μ

^a If h is the common difference, the first series is h, 2h, $3h \dots nh$, and the second series is nh, nh... to n terms, its sum obviously being n^2h . The lemma asserts that

 $²⁽h+2h+3h+\ldots n-1h) < n^2h < 2(h+2h+3h+\ldots nh)$. It is proved in the book On Spirals, Prop. 11. The proof is geometrical, lines being placed side by side to represent the 166

equal quantity, which common difference is equal to the least term, and if there be a second series of magnitudes, equal to the first in number, in which each term is equal to the greatest term [in the first series], the sum of the magnitudes in the series in which each term is equal to the greatest term is less than double of the sum of the magnitudes differing by an equal quantity, but greater than double of the sum of those magnitudes less the greatest term. The proof of this is clear.^a

Ibid., Prop. 1, Archim. ed. Heiberg i. 260. 26-261. 22

If there be a series of magnitudes, as many as you please, and it be equal in number to another series of magnitudes, and the terms have the same ratio two by two, and if any or all of the first series of magnitudes form any proportion with another series of magnitudes, and if the second series of magnitudes form the same proportion with the corresponding terms of another series of magnitudes, the sum of the first series of magnitudes bears to the sum of those with which they are in proportion the same ratio as the sum of the second series of magnitudes bears to the sums of the terms with which they are in proportion.

Let the series of magnitudes A, B, Γ , Δ , E, Z be equal in number to the series of magnitudes H, Θ , I,

terms of the arithmetical progression and produced until each is equal to the greatest term. It is equivalent to this algebraical proof:

Let $Sn = h + 2h + 3h + \dots + nh$. Then $Sn = nh + (n-1)h + (n-2)h + \dots + h$. Adding, 2Sn = n(n+1)h, and so $2S_{n-1} = (n-1)nh$. Therefore $2S_{n-1} < n^2h < 2Sn$.

i.e., permutand	$\mathbf{A} + \mathbf{B} : \mathbf{H} + \mathbf{\Theta} = \mathbf{A} : \mathbf{H}.$	[Eucl. v. 16
But since	N:A=T:H,	[$ex\ hyp$.
··.	A: H = N: T	[Eucl. v. 16
	$=\Xi:\Upsilon$	[ibid.
	$=$ O : Φ	[ibid.
	$=\Gamma:I.$	[ibid.
••	$A + B : H + \Theta = \Gamma : I$.	•
.•. A+	$B+\Gamma: H+\Theta+I=\Gamma: I$	[Eucl. v. 18
	$=0:\Phi$	[Eucl. v. 16

K, A, M, and let them have the same ratio two by two, so that

$$A:B=H:\Theta, B:\Gamma=\Theta:I$$

and so on, and let the series of magnitudes Λ , B, Γ , Δ , E, Z form any proportion with another series of magnitudes N, Ξ , O, Π , P, Σ , and let H, Θ , I, K, Λ , N form the same proportion with the corresponding terms of another series, T, Y, Φ , X, Ψ , Ω so that

$$A: N = H: T, B: \Xi = \theta: Y$$

and so on; it is required to prove that

$$\frac{A+B+\Gamma+\Delta+E+Z}{X+\Xi+O+H+P+\Sigma} = \frac{H+\Theta+I+K+\Lambda+M}{T+Y+\Phi+X+\Psi+\Omega}.$$

$$=\Pi : X \qquad [ibid.$$

= Δ : K. [ibid.

By pursuing this method it may be proved that

$$A + B + \Gamma + \Delta + E + Z : H + \Theta + I + K + \Lambda + M = \Lambda : H$$
, or, permutando,

$$A+B+\Gamma+\Delta+E+Z:A=H+\Theta+I+K+\Lambda+M:H. \quad \textbf{(1)}$$
 Now
$$N:\Xi=T:\Upsilon;$$

:. componendo et permutando,

$$N + \Xi : T + \Upsilon = \Xi : \Upsilon$$
 [Eucl. v. 18, v. 16]

$$=0:\Phi$$
; [Eucl. v. 16

whence
$$N + \Xi + O : T + \Upsilon + \Phi = O : \Phi$$
, [Eucl. v. 18]

and so on until we obtain

$$N + \Xi + O + \Pi + P + \Sigma : T + \Upsilon + \Phi + X + \Psi + \Omega = N : T . \qquad (2)$$

But
$$A : N = H : T;$$
 [ex hyp.

 \therefore by (1) and (2),

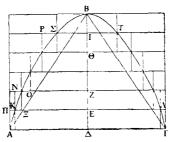

$$\frac{A+B+\Gamma+\Delta+E+Z}{N+\Xi+O+\Pi+P+\Sigma} = \frac{H+\Theta+I+K+\Delta+M}{T+\Gamma+\Phi+X+\Psi+\Phi+X}$$

(iii.) Volume of a Segment of a Paraboloid of Revolution

Ibid., Prop. 21, Archim. ed. Heiberg i. 344. 21-354. 20

Any segment of a right-angled conoid cut off by a plane perpendicular to the axis is one-and-a-half times the cone having the same base as the segment and the same axis.

For let there be a segment of a right-angled conoid cut off by a plane perpendicular to the axis, and let it be cut by another plane through the axis, and let the section be the section of a right-angled cone $AB\Gamma$, and let ΓA be a straight line in the plane cutting off the segment, and let $B\Delta$ be the axis of the segment, and let there be a cone, with vertex B, having the same base and the same axis as the segment. It is required to prove that the segment of the conoid is one-and-a-half times this cone.

For let there be set out a cone Ψ one-and-a-half times as great as the cone with base about the diameter $A\Gamma$ and with axis $B\Delta$, and let there be a

[•] It is proved in Prop. 11 that the section will be a parabola.

τὸν κύκλον τὸν περὶ διάμετρον τὰν $A\Gamma$, ἄξονα δὲ τὰν $B\Delta$ · ἐσσεῖται οὖν ὁ Ψ κῶνος ἡμίσεος τοῦ κυλίνδρου [ἐπείπερ ἡμιόλιός ἐστιν ὁ Ψ κῶνος τοῦ αὐτοῦ κώνου]. λέγω, ὅτι τὸ τμᾶμα τοῦ κωνοειδέος ἴσον ἐστὶ τῷ Ψ κών φ .

Εί γὰρ μή ἐστιν ἴσον, ἤτοι μεῖζόν ἐντι ἢ ἔλασσον. ἔστω δὴ πρότερον, εἰ δυνατόν, μεῖζον. έγγεγράφθω δή σχήμα στερεόν είς τὸ τμᾶμα, καὶ άλλο περιγεγράφθω έκ κυλίνδρων ύψος ἴσον έχόντων συγκείμενον, ώστε τὸ περιγραφέν σχημα τοῦ έγγραφέντος ύπερέχειν ελάσσονι, η άλίκω ύπερέχει τὸ τοῦ κωνοειδέος τμάμα τοῦ Ψ κώνου, καὶ ἔστω τῶν κυλίνδρων, έξ ὧν σύγκειται τὸ περιγραφέν σχημα, μέγιστος μέν δ βάσιν έχων τον κύκλον τον περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΕΔ, ἐλάχιστος δὲ ὁ βάσιν μὲν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΣΤ, ἄξονα δὲ τὰν ΒΙ, τῶν δὲ κυλίνδρων, έξ ών σύγκειται τὸ έγγραφεν σχήμα, μέγιστος μὲν ἔστω ὁ βάσιν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΚΛ, ἄξονα δὲ τὰν ΔΕ, ἐλάγιστος δε ό βάσιν μεν έχων τον κύκλον τον περί διάμετρον τὰν ΣΤ, ἄξονα δὲ τὰν ΘΙ, ἐκβεβλήσθω δὲ τὰ ἐπίπεδα πάντων τῶν κυλίνδρων ποτὶ τὰν

¹ ἐπείπερ . . . κώνου om. Heiberg.

 $^{^{\}sigma}$ For the cylinder is three times, and the cone Ψ one-and-a-172

cylinder having for its base the circle about the diameter $A\Gamma$ and for its axis $B\Delta$: then the cone Ψ is one-half of the cylinder α ; I say that the segment of the conoid is equal to the cone Ψ .

If it be not equal, it is either greater or less. Let it first be, if possible, greater. Then let there be inscribed in the segment a solid figure and let there be circumscribed another solid figure made up of evlinders having an equal altitude, b in such a way that the circumscribed figure exceeds the inscribed figure by a quantity less than that by which the segment of the conoid exceeds the cone Ψ [Prop. 19]; and let the greatest of the cylinders composing the circumscribed figure be that having for its base the circle about the diameter AT and for axis E Δ , and let the least be that having for its base the circle about the diameter \(\Sigma\) and for axis BI; and let the greatest of the cylinders composing the inscribed figure be that having for its base the circle about the diameter $K\Lambda$ and for axis ΔE , and let the least be that having for its base the circle about the diameter \(\sum_{\text{T}} \) and for axis ΘI ; and let the planes of all the cylinders be

half times, as great as the same cone; but because τοῦ αὐτοῦ κώνου is obscure and ἐπείπερ often introduces an interpolation, Heiberg rejects the explanation to this effect in the text.

b Archimedes has used those inscribed and circumscribed figures in previous propositions. The paraboloid is generated by the revolution of the parabola ABT about its axis B Δ . Chords K Λ .. Σ T are drawn in the parabola at right angles to the axis and at equal intervals from each other. From the points where they meet the parabola, perpendiculars are drawn to the next chords. In this way there are built up inside and outside the parabola "staggered" figures consisting of decreasing rectangles. When the parabola revolves, the rectangles become cylinders, and the segment of the paraboloid lies between the inscribed set of cylinders and the circumscribed set of cylinders.

173

ἐπιφάνειαν τοῦ κυλίνδρου τοῦ βάσιν ἔχοντος τὸν κύκλον τὸν περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΒΔ· ἐσσεῖται δὴ ὁ ὅλος κύλινδρος διῃρημένος εἰς κυλίνδρους τῷ μὲν πλήθει ἴσους τοῖς κυλίνδροις τοις έν τῷ περιγεγραμμένω σχήματι, τῷ δὲ μεγέθει ἴσους τῷ μεγίστω αὐτῶν. καὶ ἐπεὶ τὸ περιγεγραμμένον σχήμα περί τὸ τμᾶμα ἐλάσσονι ύπερέχει τοῦ ἐγγεγραμμένου σχήματος ἢ τὸ τμᾶμα τοῦ κώνου, δήλον, ὅτι καὶ τὸ ἐγγεγραμμένον σχημα εν τῷ τμάματι μεῖζόν ἐστι τοῦ Ψ΄ κώνου. ὁ δὴ πρῶτος κύλινδρος τῶν εν τῷ ὅλῳ κυλίνδρος ό έχων ἄξονα τὰν ΔΕ ποτὶ τὸν πρῶτον κύλινδρον τῶν ἐν τῷ ἐγγεγραμμένῳ σχήματι τὸν ἔχοντα άξονα τὰν ΔΕ τὸν αὐτὸν ἔχει λόγον, ὃν ά ΔΑ ποτὶ τὰν ΚΕ δυνάμει οὖτος δέ ἐστιν ὁ αὐτὸς τῷ, ὃν ἔχει \dot{a} ΒΔ ποτὶ τὰν ΒΕ, καὶ τῷ, ὃν ἔχει \dot{a} ΔΑ ποτὶ τὰν ΕΞ. ὁμοίως δὲ δειχθήσεται καὶ ὁ δεύτερος κύλινδρος τῶν ἐν τῷ ὅλῷ κυλίνδρῷ ὁ ἔχων ἄξονα τὸν ΕΖ ποτὶ τὸν δεύτερον κύλινδρον τῶν ἐν τῶ έγγεγραμμένω σχήματι τὸν αὐτὸν ἔχειν λόγον, δν ά ΠΕ, τουτέστιν ά ΔΑ, ποτὶ τὰν ΖΟ, καὶ τῶν ἄλλων κυλίνδρων ἕκαστος τῶν ἐν τῷ ὅλῳ κυλίνδρω άξονα εχόντων ἴσον τῷ ΔΕ ποτὶ εκαστον τῶν κυλίνδρων των εν τω εγγεγραμμένω σχήματι ἄξονα εχόντων τον αὐτον εξει τοῦτον τον λόγον, ον ά ήμίσεια τᾶς διαμέτρου τᾶς βάσιος αὐτοῦ ποτὶ τὰν ἀπολελαμμέναν ἀπ' αὐτᾶς μεταξὺ τᾶν $AB,\ B\Delta$ εὐθειᾶν καὶ πάντες οὖν οἱ κυλίνδροι οἱ ἐν τῶ κυλίνδρω, οὖ βάσις μέν ἐστιν ὁ κύκλος ὁ περὶ διάμετρον τὰν ${

First cylinder in whole cylinder $\Xi \Delta \Lambda$.

Second cylinder in inscribed figure $\Xi \Delta \Lambda$.

Second cylinder in whole cylinder $\Xi \Delta \Lambda$.

Second cylinder in inscribed figure $\Xi \Delta \Lambda$.

the radii of the circles, which are the bases of the aforesaid cylinders, bears to the sum of the straight lines cut off from them between AB, $B\Delta^a$ But the sum of the aforesaid straight lines is greater than double of the aforesaid straight lines without $A\Delta^b$; so that the sum of the cylinders in the cylinder whose axis is ΔI is greater than double of the inscribed figure; therefore the whole cylinder, whose axis is ΔB , is greater by far than double of the inscribed figure. But it was double of the cone Ψ ; therefore the inscribed figure is less than the cone Ψ ; which is impossible, for it was proved to be greater. Therefore the conoid is not greater than the cone Ψ .

Similarly [it can be shown] not to be less; for let the figure be again inscribed and another circumscribed so that the excess is less than that by which the cone Ψ exceeds the conoid, and let the rest of the construction be as before. Then because the inscribed figure is less than the segment, and the inscribed figure is less than the circumscribed by some quantity less than the difference between the segment and the cone Ψ , it is clear that the circumscribed figure is less than the cone Ψ . Again, the first

This follows from Prop. 1, for

First cylinder in whole cylinder $= 1 = \frac{\Delta A}{E\Pi}$,

and so on, and thus the other condition of the theorem is satisfied.

 b For ΔA , EE, ZO . . . is a series diminishing in arithmetical progression, and ΔA , EII . . . is a series, equal in number, in which each term is equal to the greatest in the arithmetical progression. Therefore, by the Lemma to Prop. 1,

$$\Delta A + E\Pi + ... > 2(E\Xi + ZO + ...).$$

πρώτος κύλινδρος των έν τῷ ὅλω κυλίνδρω ὁ ἔχων άξονα τὰν ΔΕ ποτὶ τὸν πρώτον κύλινδρον τῶν ἐν τῷ περιγεγραμμένω σχήματι τὸν τὸν αὐτὸν ἔχοντα άξονα τὰν ΕΔ τὸν αὐτὸν ἔχει λόγον, ὃν τὸ ἀπὸ τᾶς ΑΔ τετράγωνον ποτὶ το αὐτό, ο δε δεύτερος κύλινδρος τῶν ἐν τῶ ὅλω κυλίνδρω ὁ ἔχων ἄξονα τὰν ΕΖ ποτὶ τὸν δεύτερον κύλινδρον τῶν ἐν τῶ περιγεγραμμένω σχήματι τὸν ἔχοντα ἄξονα τὰν ΕΖ΄ τὸν αὐτὸν ἔχει λόγον, δυ ά ΔΑ ποτί τὰν ΚΕ δυνάμει ούτος δέ έστιν ο αυτός τῶ, ον ἔχει ὁ ΒΔ ποτί τὰν ΒΕ, καὶ τῷ, ὁν ἔχει ά ΔΑ ποτί τὰν ΕΞ. καὶ τῶν ἄλλων κυλίνδρων έκαστος τῶν ἐν τῷ ὅλω κυλίνδρω ἄξονα έχόντων ἴσον τᾶ ΔΕ ποτὶ ἕκαστον τῶν κυλίνδρων τῶν ἐν τῷ περιγεγραμμένω σχήματι άξονα εχόντων τὸν αὐτόν, έξει τοῦτον τὸν λόγον. ον ά ημίσεια τας διαμέτρου τας βάσιος αὐτοῦ ποτὶ τὰν ἀπολελαμμέναν ἀπ' αὐτᾶς μεταξὺ τᾶν ΑΒ, ΒΔ εὐθειᾶν καὶ πάντες οὖν οἱ κυλίνδροι οἱ ἐν τῶ όλω κυλίνδρω, οδ ἄξων ἐστὶν ά ΒΔ εὐθεῖα, ποτὶ πάντας τους κυλίνδρους τους εν τῷ περιγεγραμμένω σχήματι τὸν αὐτὸν έξοῦντι λόγον, ὃν πᾶσαι αί εὐθεῖαι ποτὶ πάσας τὰς εὐθείας. αί δὲ εὐθεῖαι πάσαι αί ἐκ τῶν κέντρων τῶν κύκλων, οι βάσιές έντι τῶν κυλίνδρων, τᾶν εὐθειᾶν πασᾶν τᾶν ἀπολελαμμεναν ἀπ' αὐταν σὺν τα ΑΔ ἐλάσσονές ἐντι

First cylinder in whole cylinder

First cylinder in circumscribed figure

Second cylinder in whole cylinder

Second cylinder in circumscribed figure $\Delta A = EII$ EE'

and so on.

^a As before,

cylinder of those in the whole cylinder, having ΔE for its axis, bears to the first cylinder of those in the circumscribed figure, having the same axis $E\Delta$, the ratio $A\Delta^2: A\Delta^2$; the second cylinder in the whole cylinder, having EZ for its axis, bears to the second cylinder in the circumscribed figure, having EZ also for its axis, the ratio ΔA^2 : KE^2 ; this is the same as $B\Delta : BE$, and this is the same as $\Delta A : E\Xi$; and each of the other cylinders in the whole cylinder, having its axis equal to ΔE , will bear to the corresponding cylinder in the circumscribed figure, having the same axis, the same ratio as half the diameter of the base bears to the portion cut off from it between the straight lines AB, $B\Delta$; and therefore the sum of the cylinders in the whole cylinder, whose axis is the straight line BA, bears to the sum of the cylinders in the circumscribed figure the same ratio as the sum of the one set of straight lines bears to the sum of the other set of straight lines. But the sum of the radii of the circles which are the bases of the cylinders is less than double of the sum of the straight lines cut off from them together with $A \Delta b$; it is therefore clear

And

First cylinder in whole cylinder Second cylinder in whole cylinder and so on. $= 1 = \frac{\Delta A}{EH}$

Therefore the conditions of Prop. 1 are satisfied and

$$\frac{\text{Whole cylinder}}{\text{Circumscribed figure}} = \frac{\Delta A + E\Pi + \dots}{\Delta A + E\Xi + \dots}$$

^b As before, $\triangle A$, $E\Xi \dots$ is a series diminishing in arithmetical progression, and $\triangle A$, $E\Pi \dots$ is a series, equal in number, in which each term is equal to the greatest in the arithmetical progression.

Therefore, by the Lemma to Prop. 1,

$$\Delta A + E\Pi + \dots < 2(\Delta A + E\Xi + \dots).$$

η διπλάσιαι· δηλον οὖν, ὅτι καὶ οἱ κυλίνδροι πάντες οἱ ἐν τῷ ὅλῳ κυλίνδρῳ ἐλάσσονές ἐντι ἢ διπλάσιοι τῶν κυλίνδρων τῶν ἐν τῷ περιγεγραμμένῳ σχήματι· ὁ ἄρα κύλινδρος ὁ βάσιν ἔχων τὸν κύκλον τὸν περὶ διάμετρον τὰν ΑΓ, ἄξονα δὲ τὰν ΒΔ, ἐλάσσων ἐστὶν ἢ διπλασίων τοῦ περιγεγραμμένου σχήματος. οὐκ ἔστι δέ, ἀλλὰ μείζων ἢ διπλάσιος· τοῦ γὰρ Ψ κώνου διπλασίων ἐστί, τὸ δὲ περιγεγραμμένον σχῆμα ἔλαττον ἐδείχθη τοῦ Ψ κώνου. οὐκ ἄρα ἐστὶν οὐδὲ ἔλασσον τὸ τοῦ κωνοειδέος τμᾶμα τοῦ Ψ κώνου. ἐδείχθη δέ, ὅτι οὐδὲ μεῖζον· ἡμιόλιον ἄρα ἐστὶν τοῦ κώνου τοῦ βάσιν ἔχοντος τὰν αὐτὰν τῷ τμάματι καὶ ἄξονα τὸν αὐτόν.

For, if n be the number of cylinders in the whole cylinder, and $A\Delta = nh$. Archimedes has shown that

Whole cylinder Inscribed figure

$$= \frac{n^2h}{h + 2h + 3h + \dots (n-1)h}$$
>2, [Lemma to Prop. 1]

and

Whole cylinder
$$\frac{n^2h}{\text{Circumscribed figure}} = \frac{n^2h}{n+2h+3h+\ldots+nh}$$
<2. [ibid.

In Props. 19 and 20 he has meanwhile shown that, by increasing n sufficiently, the inscribed and circumscribed figures can be made to differ by less than any assigned volume.

^a Archimedes' proof may be shown to be equivalent to an integration, as Heath has done (*The Works of Archimedes*, calvii-calviii).

that the sum of all the cylinders in the whole cylinder is less than double of the cylinders in the circumscribed figure: therefore the cylinder having for its base the circle about the diameter $A\Gamma$ and for axis $B\Delta$ is less than double of the circumscribed figure. But it is not, for it is greater than double; for it is double of the cone Ψ , and the circumscribed figure was proved to be less than the cone Ψ . Therefore the segment of the conoid is not less than the cone Ψ . But it was proved not to be greater; therefore it is one-and-a-half times the cone having the same base as the segment and the same axis.

When n is increased, h is diminished, but their product remains constant; let nh=c.

Then the proof is equivalent to an assertion that, when n is indefinitely increased,

limit of $h[h+2h+3h+...+(n-1)h]=\frac{1}{2}c^2$,

which, in the notation of the integral calculus reads,

$$\int_{0}^{c} x dx = \frac{1}{2}c^{2}.$$

If the paraboloid is formed by the revolution of the parabola $y^2 = ax$ about its axis, we should express the volume of a segment as

 $\int_{0}^{c} \pi y^{2} dx,$ $\pi a. \int_{0}^{c} x dx.$

or

The constant does not appear in Archimedes' proof because he merely compares the volume of the segment with the cone, and does not give its absolute value. But his method is seen to be equivalent to a genuine integration.

As in other cases, Archimedes refrains from the final step of making the divisions in his circumscribed and inscribed figures indefinitely large; he proceeds by the orthodox method of reductio ad absurdum.

the direction of the revolution be called *forward*, and let those on the other side be called *rearward*.

7. Let the circle described with the origin as centre and the first distance as radius be called the *first circle*, let the circle described with the same centre and double of the radius of the first circle ^a be called the *second circle*, and let the remaining circles in order be called after the same manner.

(ii.) Fundamental Property

Ibid., Prop. 14, Archim. ed. Heiberg ii. 50, 9-52, 15

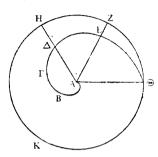

If. from the origin of the spiral, two straight lines be drawn to meet the first turn of the spiral and produced to meet the circumference of the first circle, the lines drawn to the spiral will have the same ratio one to the other as the arcs of the circle between the extremity of the spiral and the extremities of the straight lines produced to meet the circumference, the arcs being measured in a forward direction from the extremity of the spiral.

Let $AB\Gamma\Delta E\theta$ be the first turn of a spiral, let the point A be the origin of the spiral, let θA be the initial line, let θKH be the first circle, and from the point A let ΔE , $A\Delta$ be drawn to meet the spiral and be produced to meet the circumference of the circle at Z, H. It is required to prove that $\Delta E: \Delta\Delta = \text{are } \theta KZ: \text{are } \theta KH.$

When the line $A\Theta$ revolves it is clear that the point

a i.e., with radius equal to the sum of the radii of the first and second circles.

τὸ μὲν Θ σαμείον κατὰ τᾶς τοῦ ΘΚΗ κύκλου περιφερείας ἐνηνεγμένον ἐστὶν ἰσοταχέως, τὸ δὲ

Α κατὰ τᾶς εὐθείας φερόμενον τὰν ΑΘ γραμμὰν πορεύεται, καὶ τὸ Θ σαμεῖον κατὰ τᾶς τοῦ κύκλου περιφερείας φερόμενον τὰν ΘΚΖ περιφέρειαν, τὸ δὲ Α τὰν ΑΕ εὐθεῖαν, καὶ πάλιν τό τε Α σαμεῖον τὰν ΑΔ γραμμὰν καὶ τὸ Θ τὰν ΘΚΗ περιφέρειαν, εκάτερον ἰσοταχέως αὐτὸ έαυτῷ φερόμενον· δῆλον οὖν, ὅτι τὸν αὐτὸν ἔχοντι λόγον ά ΑΕ ποτὶ τὰν ΑΔ, ὃν ἀ ΘΚΖ περιφέρεια ποτὶ τὰν ΘΚΗ περιφέρειαν [δέδεικται γὰρ τοῦτο ἔξω ἐν τοῖς πρώτοις].¹

Όμοίως δὲ δειχθήσεται, καὶ εἴ κα ά ἐτέρα τᾶν ποτιπιπτουσᾶν ἐπὶ τὸ πέρας τᾶς ἔλικος ποτιπίπτη, ὅτι τὸ αὐτὸ συμβαίνει.

(iii.) A Verging

Ibid., Prop. 7, Archim. ed. Heiberg ii. 22, 14-24, 7

Τῶν αὐτῶν δεδομένων καὶ τᾶς ἐν τῷ κύκλῳ εὐθείας ἐκβεβλημένας δυνατόν ἐστιν ἀπὸ τοῦ 186

 Θ moves uniformly round the circumference ΘKH of the circle while the point A, which moves along the straight line, traverses the line $A\Theta$; the point Θ which moves round the circumference of the circle traverses the arc ΘKZ while A traverses the straight line AE; and furthermore the point A traverses the line $A\Delta$ in the same time as Θ traverses the arc ΘKH , each moving uniformly; it is clear, therefore, that $AE: A\Delta = arc \ \Theta KZ: arc \ \Theta KH \ [Prop. 2].$

Similarly it may be shown that if one of the straight lines be drawn to the extremity of the spiral the

same conclusion follows.4

(iii.) A Verging b

Ibid., Prop. 7, Archim. ed. Heiberg ii. 22, 14-24, 7

With the same data and the chord in the circle produced, it is possible to draw a line from the centre to meet

^a In Prop. 15 Archimedes shows (using different letters, however) that if AE, $A\Delta$ are drawn to meet the *second* turn of the spiral, while AZ, AH are drawn, as before, to meet the circumference of the *first* circle, then

AE: $A\Delta = arc \Theta KZ + circumference of first circle: arc \Theta KH + circumference of first circle.$

and so on for higher turns.

In general, if E, Δ lie on the *n*th turn of the spiral, and the circumference of the first circle is c, then

AE: $A\Delta = \text{arc } \Theta KZ + \overline{n-1}c$: arc $\Theta KH + \overline{n-1}c$.

These theorems correspond to the equation of the curve $\tau = a\theta$ in polar co-ordinates.

^b This theorem is essential to the one that follows.

See n. a on this page.

^a AΓ is a chord in a circle of centre K, and BN is the diameter drawn parallel to AT and produced. From K. KΘ is drawn perpendicular to AΓ, and ΓΛ is drawn perpendicular to $\hat{K}\Gamma$ so as to meet the diameter in Λ . Archimedes asserts that it is possible to draw KE to meet the circle in I and A Γ produced in E so that EI: I Γ =Z: H, an assigned ratio, provided that $Z: H > \Gamma\Theta : \Theta K$. The straight line ΓI meets BA in N. In Prop. 5 Archimedes has proved a similar proposition when AF is a tangent, and in Prop. 6 he has proved the proposition for the case where the positions of I, Γ are reversed.

^b For triangle ΓΙΕ is similar to triangle KIN, and therefore $KI : IN = EI : I\Gamma$ [Eucl. vi. 4]; and $KI = K\Gamma$.

^c The type of problem known as νεύσεις, rergings, has already been encountered (vol. i. p. 244 n. a). In this proposition, as in Props. 5 and 6, Archimedes gives no hint how 188

the produced chord so that the distance between the circumference and the produced chord shall bear to the distance between the extremity of the line intercepted [by the circle] and the extremity of the produced chord an assigned ratio, provided that the given ratio is greater than that which half of the given chord in the circle bears to the perpendicular drawn to it from the centre.

Let the same things be given, and let the chord in the circle be produced, and let the given ratio be Z:H, and let it be greater than $\Gamma \theta: \theta K$; therefore it will be greater than $K\Gamma: \Gamma \Lambda$ [Eucl. vi. 4]. Then Z:H is equal to the ratio of $K\Gamma$ to some line less than $\Gamma \Lambda$ [Eucl. v. 10]. Let it be to IN verging upon Γ —for it is possible to make such an intercept—and IN will fall within $\Gamma \Lambda$, since it is less than $\Gamma \Lambda$.

Then since $K\Gamma : IN = Z : H$, therefore b $EI : I\Gamma = Z : H$.

the construction is to be accomplished, though he was presumably familiar with a solution.

In the figure of the text, let T be the foot of the perpen-

(iv.) Property of the Subtangent

Ibid., Prop. 20, Archim. ed. Heiberg ii. 72. 4-74. 26

"Εστω ἔλιξ, ἐφ' ἆs ἁ ΑΒΓΔ, ἐν τᾳ πρώτᾳ περιφορᾳ γεγραμμένα, καὶ ἐπιψαυέτω τις αὐτᾶς εὐθεῖα ἁ ΕΖ κατὰ τὸ Δ, ἀπὸ δὲ τοῦ Δ ποτὶ τὰν

dicular from Γ to BA, and let Δ be the other extremity of the diameter through B. Let the unknown length KN=x, let $\Gamma T=a$, KT=b, $B\Delta=2c$, and let IN=k, a given length.

Then $NI \cdot N\Gamma = N\Delta \cdot NB$,

i.e., $k\sqrt{a^2+(x-b)^2}=(x-c)(x+c)$,

which, after rationalization, is an equation of the fourth degree in x.

Alternatively, if we denote N Γ by y, we can determine x and y by the two equations

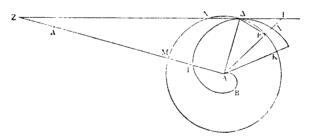

$$y^2 = a^2 + (x - b)^2$$
,
 $ky = x^2 - c^2$,

(iv.) Property of the Subtangent

Ibid., Prop. 20, Archim. ed. Heiberg ii. 72, 4-74, 26

If a straight line touch the first turn of the spiral other than at the extremity of the spiral, and from the point of contact a straight line be drawn to the origin, and with the origin as centre and this connecting line as radius a circle be drawn, and from the origin a straight line be drawn at right angles to the straight line joining the point of contact to the origin, it will meet the tangent, and the straight line between the point of meeting and the origin will be equal to the arc of the circle between the point of contact and the point in which the circle cuts the initial line, the arc being measured in the forward direction from the point on the initial line.

Let $AB\Gamma\Delta$ lie on the first turn of a spiral, and let

the straight line EZ touch it at Δ , and from Δ let $A\Delta$

so that values of x and y satisfying the conditions of the problem are given by the points of intersection of a certain parabola and a certain hyperbola.

The whole question of veryings, including this problem, is admirably discussed by Heath, The Works of Archimedes,

c-cxxii.

^a For in Prop. 16 the angle AΔZ was shown to be acute.
^b For ΔN touches the spiral and so can have no part within the spiral, and therefore cannot pass through A; therefore it is a chord of the circle and less than the diameter.

 $^{^{\}circ}$ For, if a perpendicular be drawn from A to ΔN , it bisects 192

be drawn to the origin, and with centre A and radius $A\Delta$ let the circle ΔMN be described, and let this circle cut the initial line at K, and let ZA be drawn at right angles to $A\Delta$. That it will meet $[Z\Delta]$ is clear a ; it is required to prove that the straight line ZA is equal to the arc $KMN\Delta$.

If not, it is either greater or less. Let it first be, if possible, greater, and let ΛA be taken less than the straight line ZA, but greater than the arc $KMN\Delta$ [Prop. 4]. Again, KMN is a circle, and in this circle ΔN is a line less than the diameter, and the ratio $\Delta A:A\Lambda$ is greater than the ratio of half ΔN to the perpendicular drawn to it from A^c ; it is therefore possible to draw from A a straight line AE meeting $N\Delta$ produced in such a way that

$$EP : \Delta P = \Delta A : AA :$$

for this has been proved possible [Prop. 7]; therefore

$$EP : AP = \Delta P : A\Lambda d$$

But $\Delta P : A\Lambda < arc \Delta P : arc KM\Delta$,

since ΔP is less than the arc ΔP and $A\Lambda$ is greater than the arc $KM\Delta$;

- \therefore EP: PA < arc \triangle P: arc KM \triangle ;
- \therefore AE : AP < arc KMP : arc KM \triangle .

Eucl. v. 18

 ΔN [Eucl. iii. 3] and divides triangle ΔAZ into two triangles of which one is similar to triangle ΔAZ [Eucl. vi. 8]; therefore

$$\Delta A : AZ = \frac{1}{2}N\Delta :$$
 (perpendicular from A to N Δ).

[Eucl. vi. 4

But $AZ > A\Lambda$:

- $\Delta A: A\Lambda > \frac{1}{2}N\Delta:$ (perpendicular from A to NA).
- ^d For $\Delta A = AP$, being a radius of the same circle; and the proportion follows *permutando*.

193

φέρειαν. ὂν δὲ λόγον ἔχει ά ΚΜΡ ποτὶ τὰν ΚΜΔ περιφέρειαν, τοῦτον ἔχει ά ΧΑ ποτὶ ΑΔ· ἐλάσσονα ἄρα λόγον ἔχει ά ΕΛ ποτὶ ΑΡ ἢ ά ΑΧ ποτὶ ΔA · ὅπερ ἐστὶν ἀδύνατον. οὐκ ἄρα μείζων ά ZA τᾶς ΚΜΔ περιφερείας. ὁμοίως δὲ τοῖς πρότερον δειχθήσεται, ὅτι οὐδὲ ἐλάσσων ἐστίν· ἴσα ἄρα.

(f) SEMI-REGULAR SOLIDS

Papp. Coll. v. 19, ed. Hultsch i. 352, 7-354, 10

Πολλά γὰρ ἐπινοῆσαι δυνατὸν στερεὰ σχήματα παντοίας ἐπιφανείας ἔχοντα, μᾶλλον δ' ἄν τις ἀξιώσειε λόγου τὰ τετάχθαι δοκοῦντα [καὶ τούτων πολὺ πλέον τούς τε κώνους καὶ κυλίνδρους καὶ τὰ καλούμενα πολύεδρα].¹ ταῦτα δ' ἐστὶν οὐ μόνον τὰ παρὰ τῷ θειοτάτῳ Πλάτωνι πέντε σχήματα, τουτέστιν τετράεδρόν τε καὶ ἐξάεδρον, ὀκτάεδρόν τε καὶ δωδεκάεδρον, πέμπτον δ' εἰκοσάεδρον, ἀλλὰ καὶ τὰ ὑπὸ 'Αρχιμήδους εὐρεθέντα τρισκαίδεκα τὸν ἀριθμὸν ὑπὸ ἰσοπλεύρων μὲν καὶ ἰσογωνίων οὐχ ὁμοίων δὲ πολυγώνων περιεχόμενα.

1 καὶ . . . πολύεδρα om. Hult-ch.

^a This part of the proof involves a *rerging* assumed in Prop. 8, just as the earlier part assumed the *rerging* of Prop. 7. The verging of Prop. 8 has already been described (vol. i. p. 350 n. b) in connexion with Pappus's comments on it.

b Archimedes goes on to show that the theorem is true even if the tangent touches the spiral in its second or some higher turn, not at the extremity of the turn; and in Props. 18 and 19 he has shown that the theorem is true if the tangent should touch at an extremity of a turn.

Now are KMP : are KM Δ = XA : A Δ ; [Prop. 14 \therefore EA : AP < AX : Δ A;

which is impossible. Therefore $Z\Lambda$ is not greater than the arc $KM\Delta$. In the same way as above it may be shown to be not less a; therefore it is equal.

(f) Semi-Regular Solids

Pappus, Collection v. 19, ed. Hultsch i. 352, 7-354, 10

Although many solid figures having all kinds of surfaces can be conceived, those which appear to be regularly formed are most deserving of attention. Those include not only the five figures found in the godlike Plato, that is, the tetrahedron and the cube, the octahedron and the dodecahedron, and fifthly the icosahedron, but also the solids, thirteen in number, which were discovered by Archimedes and are contained by equilateral and equiangular, but not similar, polygons.

As Pappus (ed. Hultsch 302, 14-18) notes, the theorem can be established without recourse to propositions involving solid loci (for the meaning of which see vol. i. pp. 348-349), and proofs involving only "plane" methods have been developed by Tannery, Mémoires soientifiques, i., 1912, pp. 300-316 and Heath, H.G. M. ii. 556-561. It must remain a puzzle why Archimedes chose his particular method of proof, especially as Heath's proof is suggested by the figures of Props. 6 and 9: Heath (loc. cit., p. 557) says "it is scarcely possible to assign any reason except his definite preduction for the form of proof by reductio ad absardum based ultimately on his famous 'Lemma' or Axiom."

^c For the five regular solids, see vol. i. pp. 216-225.

^d Heron (*Definitions* 104, ed. Heiberg 66, 1-9) asserts that two were known to Plato. One is that described as P_2 below, but the other, said to be bounded by eight squares and six triangles, is wrongly given.

195

Τὸ μὲν γὰρ πρῶτον ὀκτάεδρόν ἐστιν περιεχό-

μενον ύπὸ τρινώνων δ καὶ έξανώνων δ.

Τρία δὲ μετὰ τοῦτο τεσσαρεσκαιδεκάεδρα, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις η καὶ τετραγώνοις ε, τὸ δὲ δεύτερον τετραγώνοις ε καὶ έξαγώνοις η, τὸ δὲ τρίτον τριγώνοις η καὶ ὀκταγώνοις 5.

Μετά δὲ ταῦτα ἐκκαιεικοσάεδρά ἐστιν δύο, ὧν τὸ μὲν πρῶτον περιέχεται τριγώνοις η καὶ τετραγώνοις τη, το δε δεύτερον τετραγώνοις τβ, έξα-

γώνοις ή καὶ ὀκταγώνοις 5.

Μετά δὲ ταῦτα δυοκαιτριακοντάεδρά ἐστιν τρία. ών τὸ μὲν πρῶτον περιέχεται τριγώνοις κ καὶ πεντανώνοις ιβ, τὸ δὲ δεύτερον πενταγώνοις ιβ καὶ έξαγώνοις κ, τὸ δὲ τρίτον τριγώνοις κ καὶ δεκανώνοις ιβ.

Μετά δὲ ταῦτα ἔν ἐστιν ὀκτωκαιτριακοντάεδρον περιεχόμενον ύπο τριγώνων λβ καὶ τετραγώνων 5.

Μετά δὲ ταῦτα τελευταῖόν ἐστιν δυοκαιενενηκοντάεδρον, ο περιέχεται τριγώνοις π καὶ πεντα-

νώνοις ιβ.

^a For the purposes of n. b, the thirteen polyhedra will be

designated as $P_1, P_2 \dots P_{13}$.

^b Kepler, in his Harmonice mundi (Opera, 1864, v. 123-126), appears to have been the first to examine these figures systematically, though a method of obtaining some is given in a scholium to the Vatican Ms. of Pappus. If a solid angle of a regular solid be cut by a plane so that the same length is cut off from each of the edges meeting at the solid angle. 196

The first is a figure of eight bases, being contained

by four triangles and four hexagons $[P_1]$.

After this come three figures of fourteen bases, the first contained by eight triangles and six squares $[P_2]$, the second by six squares and eight hexagons $[P_3]$, and the third by eight triangles and six octagons $[P_4]$.

After these come two figures of twenty-six bases, the first contained by eight triangles and eighteen squares $[P_5]$, the second by twelve squares, eight

hexagons and six octagons $[P_6]$.

After these come three figures of thirty-two bases, the first contained by twenty triangles and twelve pentagons $[P_7]$, the second by twelve pentagons and twenty hexagons $[P_8]$, and the third by twenty triangles and twelve decagons $[P_9]$.

After these comes one figure of thirty-eight bases, being contained by thirty-two triangles and six

squares $[P_{10}]$.

After this come two figures of sixty-two bases, the first contained by twenty triangles, thirty squares and twelve pentagons $[P_{11}]$, the second by thirty squares, twenty hexagons and twelve decagons $[P_{12}]$.

After these there comes lastly a figure of ninetytwo bases, which is contained by eighty triangles

and twelve pentagons $[P_{13}]$.

the section is a regular polygon which is a triangle, square or pentagon according as the solid angle is composed of three, four or five plane angles. If certain equal lengths be cut off in this way from all the solid angles, regular polygons will also be left in the faces of the solid. This happens (i) obviously when the cutting planes bisect the edges of the solid, and (ii) when the cutting planes cut off a smaller length from each edge in such a way that a regular polygon is left in each face with double the number of sides. This method gives (1) from the tetrahedron, P_1 ; (2) from the

197

(g) System of expressing Large Numbers

Archim. Aren. 3, Archim. ed. Heiberg ii. 236, 17-240, 1

"Α μὲν οὖν ὑποτίθεμαι, ταῦτα χρήσιμον δὲ εξμεν ύπολαμβάνω τὰν κατονόμαξιν τῶν ἀριθμῶν ρηθημεν, ὅπως καὶ τῶν ἄλλων οἱ τῷ βιβλίῳ μὴ περιτετευχότες τῷ ποτὶ Ζεύξιππον γεγραμμένω μη πλανώνται διά το μηδέν είμεν υπέρ αυτάς έν , τώδε τῶ βιβλίω προειρημένον. συμβαίνει δὴ τὰ ονόματα τῶν ἀριθμῶν ές τὸ μὲν τῶν μυρίων ύπάρχειν άμιν παραδεδομένα, και ύπερ το των μυρίων [μὲν] ἀποχρεόντως γιγνώσκομες μυριάδων άριθμον λέγοντες έστε ποτί τας μυρίας μυριάδας. έστων οὖν άμιν οἱ μὲν νῦν εἰρημένοι ἀριθμοὶ ἐς τὰς μυρίας μυριάδας πρώτοι καλουμένοι, τών δὲ πρώτων ἀριθμῶν αἱ μύριαι μυριάδες μονὰς καλείσθω δευτέρων ἀριθμῶν, καὶ ἀριθμείσθων τῶν δευτέρων μονάδες καὶ έκ τῶν μονάδων δεκάδες καὶ έκατοντάδες καὶ χιλιάδες καὶ μυριάδες ἐς τὰς μυρίας μυριάδας. πάλιν δὲ καὶ αἱ μύριαι μυριάδες τῶν . δευτέρων ἀριθμῶν μονὰς καλείσθω τρίτων ἀριθμῶν, καὶ ἀριθμείσθων τῶν τρίτων ἀριθμῶν μονάδες καὶ ἀπὸ τᾶν μονάδων δεκάδες καὶ έκατοντάδες καὶ χιλιάδες καὶ μυριάδες ἐς τὰς μυρίας μυριάδας. τὸν αὐτὸν δὲ τρόπον καὶ τῶν τρίτων ἀριθμῶν μύριαι μυριάδες μονάς καλείσθω τετάρτων άριθμῶν,

1 μèν om. Heiberg.

cube, P_2 and P_4 ; (3) from the octahedron, P_2 and P_3 ; (4) from the icosahedron, P_7 and P_8 ; (5) from the dodecahedron, P_7 and P_9 . It was probably the method used by Plato.

Four more of the semi-regular solids are obtained by first cutting all the edges symmetrically and equally by planes parallel to the edges, and then cutting off angles. This 198

(g) System of expressing Large Numbers

Archimedes, Sand-Reckoner 3, Archim. ed. Heiberg ii. 236, 17-240, 1

Such are then the assumptions I make; but I think it would be useful to explain the naming of the numbers, in order that, as in other matters, those who have not come across the book sent to Zeuxippus may not find themselves in difficulty through the fact that there had been no preliminary discussion of it in this book. Now we already have names for the numbers up to a myriad [104], and beyond a myriad we can count in myriads up to a myriad myriads [108]. Therefore, let the aforesaid numbers up to a myriad myriads be called numbers of the first order [numbers from 1 to 108], and let a myriad myriads of numbers of the first order be called a unit of numbers of the second order [numbers from 108 to 1016], and let units of the numbers of the second order be enumerable, and out of the units let there be formed tens and hundreds and thousands and myriads up to a myriad myriads. Again, let a myriad myriads of numbers of the second order be called a unit of numbers of the third order [numbers from 1016] to 10²⁴], and let units of numbers of the third order be enumerable, and from the units let there be formed tens and hundreds and thousands and myriads up to a myriad myriads. In the same manner, let a myriad myriads of numbers of the third order be gives (1) from the cube, P_5 and P_6 : (2) from the icosahedron,

 P_{11} ; (3) from the dodecahedron, P_{12} . The two remaining solids are more difficult to obtain; P_{10} is the snub cube in which each solid angle is formed by the angles of four equilateral triangles and one square; P_{13} is the snub dodecahedron in which each solid angle is formed by the angles of four equilateral triangles and one

199

regular pentagon.

καὶ αἱ τῶν τετάρτων ἀριθμῶν μύριαι μυριάδες μονὰς καλείσθω πέμπτων ἀριθμῶν, καὶ ἀεὶ οὕτως προάγοντες οἱ ἀριθμοὶ τὰ ὀνόματα ἐχόντων ἐς τὰς μυριακισμυριοστῶν ἀριθμῶν μυρίας μυριάδας.

'Αποχρέοντι μὲν οὖν καὶ ἐπὶ τοσοῦτον οἱ ἀριθμοὶ γιγνωσκομένοι, ἔξεστι δὲ καὶ ἐπὶ πλέον προάγειν. ἔστων γὰρ οἱ μὲν νῦν εἰρημένοι ἀριθμοὶ πρώτας περιόδου καλουμένοι, ὁ δὲ ἔσχατος ἀριθμὸς τᾶς πρώτας περιόδου καλουμένοι, ὁ δὲ ἔσχατος ἀριθμὸς τᾶς πρώτας περιόδου πρώτων ἀριθμῶν. πάλιν δὲ καὶ αἱ μύριαι μυριάδες τᾶς δευτέρας περιόδου πρώτων ἀριθμῶν μονὰς καλείσθω τᾶς δευτέρας περιόδου δευτέρων ἀριθμῶν. ὁμοίως δὲ καὶ τούτων ὁ ἔσχατος μονὰς καλείσθω δευτέρας περιόδου τρίτων ἀριθμῶν, καὶ ἀεὶ οὕτως οἱ ἀριθμοὶ προάγοντες τὰ ὀνόματα ἐχόντων τᾶς δευτέρας περιόδου ἐς τὰς μυριακισμυριοστῶν ἀριθμῶν μυρίας μυριάδας.
Πάλιν δὲ καὶ ὁ ἔσχατος ἀριθμὸς τᾶς δευτέρας

Πάλιν δὲ καὶ δ ἔσχατος ἀριθμὸς τᾶς δευτέρας περιόδου μονὰς καλείσθω τρίτας περιόδου πρώτων ἀριθμῶν, καὶ ἀεὶ οὕτως προαγόντων ἐς τὰς μυριακισμυριοστῶς περιόδου μυριακισμυριοστῶν ἀριθμῶν

μυρίας μυριάδας.

[•] Expressed in full, the last number would be 1 followed by 80,000 million millions of ciphers. Archimedes uses this system to show that it is more than sufficient to express the number of grains of sand which it would take to fill the universe, basing his argument on estimates by astronomers of the sizes and distances of the sun and moon and their relation to the size of the universe and allowing a wide margin for safety. Assuming that a poppy-head (for so $\mu\bar{\eta}\kappa\omega\nu$ is here to be understood, not "poppy-seed," r. D'Arcy W. Thompson, The Classical Review, lvi. (1942), p. 75) would contain not more than 10,000 grains of sand, and that its diameter is not less than a finger's breadth, and having proved that the 200

called a unit of numbers of the fourth order [numbers from 10^{24} to 10^{32}], and let a myriad myriads of numbers of the fourth order be called a unit of numbers of the fifth order [numbers from 10^{32} to 10^{40}], and let the process continue in this way until the designations reach a myriad myriads taken a myriad myriad times $10^{8} \cdot 10^{8}$].

It is sufficient to know the numbers up to this point, but we may go beyond it. For let the numbers now mentioned be called numbers of the first period [1 to $10^{8 \cdot 10^{8}}$], and let the last number of the first period be called a unit of numbers of the first order of the second period $\begin{bmatrix} 10^{8 \cdot 10^{8}} \text{ to } 10^{8 \cdot 10^{8}} \cdot 10^{8} \end{bmatrix}$. And again, let a myriad myriads of numbers of the first order of the second period be called a unit of numbers of the second order of the second period $\begin{bmatrix} 10^{8 \cdot 10^{8}} \cdot 10^{8} \cdot 10^{8} \cdot 10^{8} \cdot 10^{16} \end{bmatrix}$. Similarly let the last of these numbers be called a unit of numbers of the third order of the second period $\begin{bmatrix} 10^{8 \cdot 10^{8}} \cdot 10^{16} \end{bmatrix}$. $\begin{bmatrix} 10^{8 \cdot 10^{8}} \cdot 10^{16} \end{bmatrix}$. and let the process continue in this way until the designations of numbers in the second period reach a myriad myriads taken a myriad myriad times $\begin{bmatrix} 10^{8 \cdot 10^{8}} \cdot 10^{8 \cdot 10^{8}}, \text{ or } (10^{8 \cdot 10^{8}})^{2} \end{bmatrix}$.

Again, let the last number of the second period be called a unit of numbers of the first order of the third period $[(10^8 \cdot 10^8)^2 \text{ to } (10^8 \cdot 10^8)^2 \cdot 10^8]$, and let the process continue in this way up to a myriad myriad units of numbers of the myriad myriadth order of the myriad myriadth period $[(10^8 \cdot 10^8)^{10^8}]$ or $10^8 \cdot 10^{16}]$.

sphere of the fixed stars is less than 107 times the sphere in which the sun's orbit is a great circle, Archimedes shows that the number of grains of sand which would fill the universe is less than "10,000,000 units of the eighth order of numbers," or 1083. The work contains several references important for the history of astronomy.

(h) Indeterminate Analysis: The Cattle Problem

Archim. (?) *Prob. Bor.*. Archim. ed. Heiberg ii, 528, 1–532, 9

(h) Indeterminate Analysis: The Cattle Problem

Archimedes (?), Cottle Problem, Archim. ed. Heiberg ii. 528, 1-532, 9

A PROBLEM

which Archimedes solved in epigrams, and which he communicated to students of such matters at Alexandria in a letter to Eratosthenes of Cyrene.

If thou art diligent and wise, O stranger, compute the number of cattle of the Sun, who once upon a time grazed on the fields of the Thrinacian isle of Sicily, divided into four herds of different colours, one milk white, another a glossy black, the third vellow and the last dappled. In each herd were bulls, mighty in number according to these proportions: Understand, stranger, that the white bulls were equal to a half and a third of the black together with the whole of the yellow, while the black were equal to the fourth part of the dappled and a fifth, together with, once more, the whole of the yellow. Observe further that the remaining bulls, the dappled, were equal to a sixth part of the white and a seventh, together with all the yellow. These were the proportions of the cows: The white were precisely equal to the third part and a fourth of the whole herd of the black; while the black were equal to the fourth part once more of the dappled and with it a fifth part, when all, including the bulls, went to pasture together. Now

" It is unlikely that the epigram itself, first edited by G. E. Lessing in 1773, is the work of Archimedes, but there is aniple evidence from antiquity that he studied the actual problem. The most important papers bearing on the subject have already been mentioned (vol. i. p. 16 n. c), and further references to the literature are given by Heiberg ad loc.

ξανθοτρίχων δ' άγέλης πέμπτω μέρει ήδε καὶ έκτω ποικίλαι ισάριθμον πληθος έχον τετραχή. ξανθαί δ' πριθμεθντο μέρους τρίτου ημίσει ίσαι ἀργεννης ἀγέλης έβδομάτω τε μέρει. ξεινε, σὺ δ', Ἡελίοιο βόες πόσαι, ἀτρεκὲς εἰπών, χωρίς μεν ταύρων ζατρεφέων αριθμόν, γωρίς δ' αὖ, θήλειαι ὅσαι κατὰ χροιὰν ἔκασται. οὐκ ἄιδρίς κε λέγοι' οὐδ' ἀριθμῶν ἀδαής, ου μήν πώ γε σοφοίς έναρίθμιος. άλλ' ἴθι φράζευ καὶ τάδε πάντα βοῶν Ἡελίοιο πάθη. άργότριχες ταθροι μέν έπεὶ μιξαίατο πληθύν κυανέοις, ισταντ' έμπεδον ισόμετροι είς βάθος είς εθρός τε, τὰ δ' αθ περιμήκεα πάντη πίμπλαντο πλήθους Θρινακίης πεδία. ξανθοί δ' αὖτ' εἰς εν καὶ ποικίλοι ἀθροισθέντες ίσταντ' αμβολάδην έξ ένδς αργόμενοι σχημα τελειούντες τὸ τρικράσπεδον οὔτε προσόντων άλλοχρόων ταύρων οὔτ' ἐπιλειπομένων. ταθτα συνεξευρών καὶ ένὶ πραπίδεσσιν άθροίσας καὶ πληθέων ἀποδούς, ξεῖνε, τὰ πάντα μέτρα έρχεο κυδιόων νικηφόρος ἴσθι τε πάντως κεκριμένος ταύτη γ' όμπνιος έν σοφίη.

1 πλήθους Krumbiegel, πλίνθου cod.

^a i.e. a fifth and a sixth both of the males and of the females.
^b At a first glance this would appear to mean that the sum of the number of white and black bulls is a square, but this makes the solution of the problem intolerably difficult. There is, however, an easier interpretation. If the bulls are packed together so as to form a square figure, their number need not be a square, since each bull is longer than it is broad. The simplified condition is that the sum of the number of white and black bulls shall be a rectangle.

the dappled in four parts a were equal in number to a fifth part and a sixth of the vellow herd. Finally the yellow were in number equal to a sixth part and a seventh of the white herd. If thou canst accurately tell, O stranger, the number of cattle of the Sun, giving separately the number of well-fed bulls and again the number of females according to each colour, thou wouldst not be called unskilled or ignorant of numbers, but not vet shalt thou be numbered among the wise. But come, understand also all these conditions regarding the cows of the Sun. When the white bulls mingled their number with the black, they stood firm, equal in depth and breadth, and the plains of Thrinacia, stretching far in all ways, were filled with their multitude. Again, when the vellow and the dappled bulls were gathered into one herd they stood in such a manner that their number, beginning from one, grew slowly greater till it completed a triangular figure, there being no bulls of other colours in their midst nor none of them lacking. If thou art able, O stranger, to find out all these things and gather them together in your mind, giving all the relations, thou shalt depart crowned with glory and knowing that thou hast been adjudged perfect in this species of wisdom.c

(i) MECHANICS: CENTRES OF GRAVITY

(i.) Postulates

Archim. De Plan. Aequil., Deff., Archim. ed. Heiberg ii. 124, 3-126, 3

α΄. Αἰτούμεθα τὰ ἴσα βάρεα ἀπὸ ἴσων μακέων ἰσορροπεῖν, τὰ δὲ ἴσα βάρεα ἀπὸ τῶν ἀνίσων μακέων μὴ ἰσορροπεῖν, ἀλλὰ ῥέπειν ἐπὶ τὸ βάρος τὸ ἀπὸ τοῦ μείζονος μάκεος.

(b)	$x = (\frac{1}{4} + \frac{1}{4})(Y + y)$			(4)
	$y = (\frac{1}{4} + 1)(W + w)$		٠	(5)
	$w=(-\div \frac{1}{6})(Z-z)$			(6)
	$z = (\frac{1}{6} + \frac{1}{7})(X + x)$			(7)

The second part of the epigram states that

$$X+Y=$$
a rectangular number . . . (8)
 $Z-W=$ a triangular number (9)

This was solved by J. F. Wurm, and the solution is given by A. Amthor, Zeitschrift für Math. u. Physik. (Hist,-litt. Abtheilung), xxv. (1880), pp. 153-171, and by Heath. The Works of Archimedes, pp. 319-326. For reasons of space, only the results can be noted here.

Equations (1) to (7) give the following as the values of the unknowns in terms of an unknown integer n:

$$X = 10366482n$$
 $x = 7206360n$
 $Y = 7460514n$ $y = 4893246n$
 $Z = 4149387n$ $z = 5439213n$
 $W = 7358060n$ $z = 3515820n$.

We have now to find a value of n such that equation (9) is also satisfied—equation (8) will then be simultaneously satisfied. Equation (9) means that

$$Z + W = \frac{p(p-1)}{2},$$

where p is some positive integer, or

$$(4149387 + 7358060)n = \frac{p(r+1)}{2},$$

(i) MECHANICS: CENTRES OF GRAVITY

(i.) Postulates

Archimedes, On Plane Equatibriums, Definitions, Archim. ed. Heiberg ii. 124, 3-126, 3

1. I postulate that equal weights at equal distances balance, and equal weights at unequal distances do not balance, but incline towards the weight which is at the greater distance.

i.e.
$$2471 \cdot 4657n = \frac{p(p-1)}{2}$$
.

This is found to be satisfied by

$$n = 3^3$$
. 4349.

and the final solution is

$$X = 1217263415886$$
 $x = 846192410280$
 $Y = 876035935422$ $y = 574579625058$
 $Z = 487233469701$ $z = 638688708099$
 $W = 864005479380$ $x = 412838131860$

and the total is 5916837175686.

If equation (8) is taken to be that X+Y=a square number, the solution is much more arduous; Another found that in this case,

$$W = 1598 \langle 206541 \rangle$$
,

where (206541) means that there are 206541 more digits to follow, and the whole number of cattle=7766 (206541). Merely to write out the eight numbers. Amthor calculates, would require a volume of 660 pages, so we may reasonably doubt whether the problem was really framed in this more difficult form, or, if it were, whether Archimedes solved it.

^a This is the earliest surviving treatise on mechanics; it presumably had predecessors, but we may doubt whether mechanics had previously been developed by rigorous geometrical principles from a small number of assumptions. References to the principle of the lever and the parallelogram of velocities in the Aristotelian Mechanics have already been given (vol. i. pp. 430-433).

β΄. εἴ κα βαρέων ἰσορροπεόντων ἀπό τινων μακέων ποτὶ τὸ ἔτερον τῶν βαρέων ποτιτεθῆ, μὴ ἰσορροπεῖν, ἀλλὰ ρέπειν ἐπὶ τὸ βάρος ἐκεῖνο, ῷ ποτετέθη.

γ'. 'Ομοίως δὲ καί, εἴ κα ἀπὸ τοῦ ἐτέρου τῶν βαρέων ἀφαιρεθῆ τι, μὴ ἰσορροπεῖν, ἀλλά ρέπειν ἐπὶ τὸ βάρος, ἀφ' οὖ οὐκ ἀφηρέθη.

δ΄. Των ίσων καὶ δμοίων σχημάτων ἐπιπέδων έφαρμοζομένων έπ' ἄλλαλα καὶ τὰ κέντρα τῶν

βαρέων έφαρμόζει έπ' άλλαλα.

έ΄. Τῶν δὲ ἀνίσων, ὁμοίων δέ, τὰ κέντρα τῶν βαρέων δμοίως ἐσσεῖται κείμενα. δμοίως δὲ λέγομες σαμεία κέεσθαι ποτὶ τὰ όμοῖα σχήματα, ἀφ' ὧν ἐπὶ τὰς ἴσας γωνίας ἀγόμεναι εὐθεῖαι ποιέοντι γωνίας ἴσας ποτὶ τὰς ὁμολόγους πλευράς.

5'. Εί κα μεγέθεα ἀπό τινων μακέων ἰσορροπέωντι, καὶ τὰ ἴσα αὐτοῖς ἀπὸ τῶν αὐτῶν μακέων

ισορροπήσει.

ζ΄. Παντός σχήματος, οδ κα ά περίμετρος ἐπὶ τὰ αὐτὰ κοίλα ἢ, τὸ κέντρον τοῦ βάρεος ἐντὸς εἶμεν δεῖ τοῦ σχήματος.

(ii.) Principle of the Lever

Ibid., Props. 6 et 7, Archim. ed. Heiberg ii. 132. 13-138. 8

Τὰ σύμμετρα μεγέθεα ἰσορροπέοντι ἀπὸ μακέων αντιπεπονθότως τον αὐτον λόγον εγόντων τοῖς

βάρεσιν.

Έστω σύμμετρα μεγέθεα τὰ Α, Β, ὧν κέντρα τὰ Α, Β, καὶ μᾶκος ἔστω τι τὸ ΕΔ, καὶ ἔστω, ὡς τὸ Α ποτὶ τὸ Β, οὕτως τὸ ΔΓ μᾶκος ποτὶ τὸ ΓΕ 208

2. If weights at certain distances balance, and something is added to one of the weights, they will not remain in equilibrium, but will incline towards that weight to which the addition was made.

3. Similarly, if anything be taken away from one of the weights, they will not remain in equilibrium, but will incline towards the weight from which

nothing was subtracted.

4. When equal and similar plane figures are applied one to the other, their centres of gravity also coincide.

- 5. In unequal but similar figures, the centres of gravity will be similarly situated. By points similarly situated in relation to similar figures, I mean points such that, if straight lines be drawn from them to the equal angles, they make equal angles with the corresponding sides.
- 6. If magnitudes at certain distances balance, magnitudes equal to them will also balance at the same distances.
- 7. In any figure whose perimeter is concave in the same direction, the centre of gravity must be within the figure.

(ii.) Principle of the Lever

Ibid., Props. 6 and 7, Archim. ed. Heiberg ii. 132. 13-138. 8

Prop. 6

Commensurable magnitudes balance at distances re-

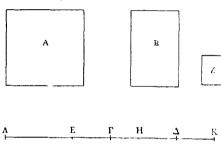

ciprocally proportional to their weights.

Let A, B be commensurable magnitudes with centres [of gravity] A, B, and let E be any distance,

 $A:B=\Delta\Gamma:\Gamma E:$ and let

μᾶκος· δεικτέον, ὅτι τοῦ ἐξ ἀμφοτέρων τῶν Α, Β συγκειμένου μεγέθεος κέντρον ἐστὶ τοῦ βάρεος τὸ Γ.

Ἐπεὶ γάρ ἐστιν, ὡς τὸ Α ποτὶ τὸ Β, οὕτως τὸ $\Delta\Gamma$ ποτὶ τὸ ΓΕ, τὸ δὲ Α τῷ Β σύμμετρον, καὶ τὸ ΓΔ ἄρα τῷ ΓΕ σύμμετρον, τουτέστιν εὐθεῖα τᾳ εὐθείᾳ· ὥστε τῶν ΕΓ, ΓΔ ἐστι κοινὸν μέτρον. ἔστω δὴ τὸ Ν, καὶ κείσθω τᾳ μὲν ΕΓ ἴσα ἑκατέρα τῶν Δ H, Δ K, τᾳ δὲ Δ Γ ἴσα ἁ ΕΛ. καὶ ἐπεὶ ἴσα

N

ά ΔΗ τậ ΓΕ, ἴσα καὶ ά ΔΓ τậ ΕΗ· ὥστε καὶ ά ΛΕ ἴσα τậ ΕΗ. διπλασία ἄρα ά μὲν ΛΗ τᾶς ΔΓ, ά δὲ ΗΚ τᾶς ΓΕ· ὥστε τὸ Ν καὶ ἐκατέραν τᾶν ΛΗ, ΗΚ μετρεῖ, ἐπειδήπερ καὶ τὰ ἡμίσεα αὐτᾶν. καὶ ἐπεί ἐστιν, ὡς τὸ Α ποτὶ τὸ Β, οὕτως ά ΔΓ ποτὶ ΓΕ, οὕτως ά ΛΗ ποτὶ ΓΕ, ὑπλασία γὰρ ἐκατέρας καὶ ὡς ἄρα τὸ Α ποτὶ τὸ Β, οὕτως ά ΛΗ ποτὶ ΗΚ—διπλασία γὰρ ἐκατέρα ἐκατέρας ΗΚ. ὁσαπλασίων δέ ἐστιν ἁ ΛΗ τᾶς Ν, τοσαυ-210

it is required to prove that the centre of gravity of the magnitude composed of both A, B is Γ .

Since
$$A: B = \Delta \Gamma: \Gamma E$$
,

and A is commensurate with B, therefore $\Gamma\Delta$ is commensurate with ΓE , that is, a straight line with a straight line [Eucl. x. 11]; so that $E\Gamma$, $\Gamma\Delta$ have a common measure. Let it be N, and let ΔH , ΔK be each equal to $E\Gamma$, and let $E\Lambda$ be equal to $\Delta\Gamma$. Then since $\Delta H = \Gamma E$, it follows that $\Delta\Gamma = EH$; so that $\Delta E = H$. Therefore $\Delta H = 2\Delta\Gamma$ and $HK = 2\Gamma E$; so that N measures both ΔH and ΔH , since it measures their halves [Eucl. x. 12]. And since

A: B =
$$\Delta \Gamma$$
: ΓE ,

while
$$\Delta\Gamma : \Gamma E = \Lambda H : HK$$
—

for each is double of the other-

therefore
$$A: B = AH: HK$$
.

Now let Z be the same part of A as X is of AII;

ταπλασίων ἔστω καὶ τὸ Α τοῦ Ζ΄ ἔστιν ἄρα, ώς ά ΛΗ ποτὶ Ν, οὕτως τὸ Α ποτὶ Ζ. ἔστι δὲ καί, ώς ά ΚΗ ποτί ΛΗ, ούτως το Β ποτί Α. δι' ἴσου ἄρα ἐστίν, ώς ά ΚΗ ποτὶ Ν, οὕτως τὸ Β ποτὶ Ζ· ισάκις ἄρα πολλαπλασίων ἐστὶν ά ΚΗ τᾶς Ν καὶ τὸ Β τοῦ Ζ. ἐδείχθη δὲ τοῦ Ζ καὶ τὸ Α πολλαπλάσιον ἐόν· ὥστε τὸ Ζ τῶν Α, Β κοινόν ἐστι μέτρον. διαιρεθείσας οὖν τᾶς μὲν ΛΗ εἰς τὰς τᾶ Ν ἴσας, τοῦ δὲ Α εἰς τὰ τῷ Ζ ἴσα, τὰ ἐν τῷ ΛΗ τμάματα ἰσομεγέθεα τὰ Ν ἴσα ἐσσεῖται τῷ πλήθει τοῖς ἐν τῷ Α τμαμάτεσσιν ἴσοις ἐοῦσιν τῷ Ζ. ωστε, αν εφ' εκαστον των τμαμάτων των έν τα ΛH ἐπιτεθ $\hat{\eta}$ μέγεθος ἴσον τ $\hat{\omega}$ Z τ $\hat{\delta}$ κέντρον το \hat{v} βάρεος έχον έπὶ μέσου τοῦ τμάματος, τά τε πάντα μεγέθεα ίσα έντι τῷ Α, και τοῦ ἐκ πάντων συγκειμένου κέντρον έσσεῖται τοῦ βάρεος τὸ Ε΄ ἄρτιά τε γάρ έστι τὰ πάντα τῶ πλήθει, καὶ τὰ ἐφ' ἑκάτερα τοῦ Ε΄ ἴσα τῷ πλήθει διὰ τὸ ἴσαν εἶμεν τὰν ΛΕ τâ HE.

"Όμοίως δὲ δειχθήσεται, ὅτι κἄν, εἴ κα ἐφ' ἔκαστον τῶν ἐν τᾳ ΚΗ τμαμάτων ἐπιτεθῆ μέγεθος ἴσον τῷ Ζ κέντρον τοῦ βάρεος ἔχον ἐπὶ τοῦ μέσου τοῦ τμάματος, τά τε πάντα μεγέθεα ἴσα ἐσοεῖται τῷ Β, καὶ τοῦ ἐκ πάντων συγκειμένου κέντρον τοῦ βάρεος ἐσσεῖται τὸ Δ· ἐσσεῖται οὖν τὸ μὲν Α ἐπικείμενον κατὰ τὸ Ε, τὸ δὲ Β κατὰ τὸ Δ. ἐσσεῖται δὴ μεγέθεα ἴσα ἀλλάλοις ἐπ' εὐθείας κείμενα, ὧν τὰ κέντρα τοῦ βάρεος ἴσα ἀπ' ἀλλάλων διέστακεν, [συγκείμενα]¹ ἄρτια τῷ πλήθει· δῆλον οὖν, ὅτι τοῦ ἐκ πάντων συγκειμένου μεγέθεος κέντρον ἐστὶ τοῦ βάρεος ὰ διχοτομία τᾶς εὐθείας τᾶς ἐχούσας τὰ κέντρα τῶν μέσων μεγεθέων. ἐπεὶ δ' ἴσαι ἐντὶ

 $\Lambda H: N = A: Z.$ [Eucl. v., Def. 5 then KH : AH = B : A :[Eucl. v. 7, coroll. And

therefore, ex aequo,

KH: N = B:Z; [Eucl. v. 22

therefore Z is the same part of B as N is of KH. Now A was proved to be a multiple of Z; therefore Z is a common measure of A, B. Therefore, if ΛH is divided into segments equal to N and A into segments equal to Z, the segments in ΛH equal in magnitude to N will be equal in number to the segments of A equal to Z. It follows that, if there be placed on each of the segments in AH a magnitude equal to Z. having its centre of gravity at the middle of the segment, the sum of the magnitudes will be equal to A, and the centre of gravity of the figure compounded of them all will be E: for they are even in number, and the numbers on either side of E will be equal because AE = HE. [Prop. 5, coroll. 2.]

Similarly it may be proved that, if a magnitude equal to Z be placed on each of the segments [equal to N in KH, having its centre of gravity at the middle of the segment, the sum of the magnitudes will be equal to B, and the centre of gravity of the figure compounded of them all will be Δ [Prop. 5, coroll. 2]. Therefore A may be regarded as placed at E, and B at Δ . But they will be a set of magnitudes lying on a straight line, equal one to another, with their centres of gravity at equal intervals, and even in number; it is therefore clear that the centre of gravity of the magnitude compounded of them all is the point of bisection of the line containing the centres [of gravity] of the middle magnitudes from Prop. 5, coroll. 2].

¹ συγκείμενα om. Heiberg.

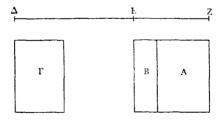

ά μὲν ΛΕ τᾶ ΓΔ, ά δὲ ΕΓ τᾶ ΔΚ, καὶ ὅλα ἄρα ά $\Lambda \Gamma$ ἴσα τᾶ ΓΚ· ὥστε τοῦ ἐκ πάντων μεγέθεος κέντρον τοῦ βάρεος τὸ Γ σαμεῖον. τοῦ μὲν ἄρα Α κειμένου κατὰ τὸ Ε, τοῦ δὲ B κατὰ τὸ Δ , ἰσορροπησοῦντι κατὰ τὸ Γ .

ζ

Καὶ τοίνυν, εἴ κα ἀσύμμετρα ἔωντι τὰ μεγέθεα, ὁμοίως ἰσορροπησοῦντι ἀπὸ μακέων ἀντιπεπονθότως τὸν αὐτὸν λόγον ἐγόντων τοῖς μεγέθεσιν.

"Εστω ἀσύμμετρα μεγέθεα τὰ AB, Γ, μάκεα δὲ τὰ ΔΕ, ΕΖ, ἐχέτω δὲ τὸ AB ποτὶ τὸ Γ τὸν αὐτὸν λόγον, δν καὶ τὸ ΕΔ ποτὶ τὸ ΕΖ μᾶκος λέγω, ὅτι τοῦ ἐξ ἀμφοτέρων τῶν AB, Γ κέντρον τοῦ βάρεός ἐστι τὸ Ε.

Εί γὰρ μὴ ἰσορροπήσει τὸ ΑΒ τεθὲν ἐπὶ τῷ Ζ τῷ Γ τεθέντι ἐπὶ τῷ Δ, ἤτοι μεῖζόν ἐστι τὸ ΑΒ

τοῦ Γ η ὤστε ἰσορροπεῖν $[τ\^{\wp} \ \Gamma]^1$ η οὔ. ἔστω μεῖζον, καὶ ἀφηρήσθω ἀπὸ τοῦ AB ἔλασσον τᾶς ὑπεροχᾶς, \mathring{a} μεῖζόν ἐστι τὸ AB τοῦ Γ η ὥστε ἰσορροπεῖν, ὧστε $[τ\grave{o}]^2$ λοιπὸν τὸ A στ΄μμετρον 214

And since $\Lambda E = \Gamma \Delta$ and $E\Gamma = \Delta K$, therefore $\Lambda \Gamma = \Gamma K$; so that the centre of gravity of the magnitude compounded of them all is the point Γ . Therefore if A is placed at E and B at Δ , they will balance about Γ .

Prop. 7

And now, if the magnitudes be incommensurable, they will likewise balance at distances reciprocally proportional to the magnitudes.

Let (A + B), Γ be incommensurable magnitudes,^a and let ΔE , EZ be distances, and let

$$(A + B) : \Gamma = E\Delta : EZ$$
;

I say that the centre of gravity of the magnitude composed of both (A+B), Γ is E.

For if (A + B) placed at Z do not balance Γ placed at Δ , either (A + B) is too much greater than Γ to balance or less. Let it [first] be too much greater, and let there be subtracted from (A + B) a magnitude less than the excess by which (A + B) is too much greater than Γ to balance, so that the remainder A is

^a As becomes clear later in the proof, the first magnitude is regarded as made up of two parts—A, which is commensurate with Γ and B, which is not commensurate; if (A+B) is too big for equilibrium with Γ , then B is so chosen that, when it is taken away, the remainder A is still too big for equilibrium with Γ . Similarly if (A+B) is too small for equilibrium.

¹ $\tau \hat{\omega} \Gamma$ om. Eutocius, ² $\tau \hat{\sigma}$ om. Eutocius.

εἶμεν τῷ Γ. ἐπεὶ οὖν σύμμετρά ἐστι τὰ Α, Γ μεγέθεα, καὶ ἐλάσσονα λόγον ἔχει τὸ Α ποτὶ τὸ Γ ἢ ά ΔE ποτὶ EZ, οὐκ ἰσορροπησοῦντι τὰ Α, Γ ἀπὸ τῶν ΔE , EZ μακέων, τεθέντος τοῦ μὲν Α ἐπὶ τῷ Z, τοῦ δὲ Γ ἐπὶ τῷ Δ . διὰ ταὐτὰ δ', οὐδ' εἰ τὸ Γ μεῖζόν ἐστιν ἢ ὥστε ἰσορροπεῖν τῷ AB.

1 δè om. Heiberg.

^a The proof is incomplete and obscure; it may be thus completed. Since $A: \Gamma < \Delta E: EZ$.

 $[\]Delta$ will be depressed, which is impossible, since there has been taken away from (A + B) a magnitude less than the deduc-216

commensurate with Γ . Then, since A, Γ are commensurable magnitudes, and

 $A:\Gamma < \Delta E:EZ,$

A, Γ will not balance at the distances ΔE , EZ, A being placed at Z and Γ at Δ . By the same reasoning, they will not do so if Γ is greater than the magnitude necessary to balance (A+B).

(iii.) Centre of Gravity of a Parallelogram b

Ibid., Props. 9 and 10, Archim. ed. Heiberg ii. 140. 16-144. 4

Prop. 9

The centre of gravity of any parallelogram is on the straight line joining the points of bisection of opposite sides of the parallelogram.

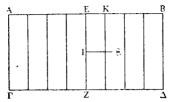

Let $ABI^{\uparrow}\Delta$ be a parallelogram, and let EZ be the straight line joining the mid-points of AB, $\Gamma\Delta$; then I say that the centre of gravity of the parallelogram $ABI^{\downarrow}\Delta$ will be on EZ.

For if it be not, let it, if possible, be Θ , and let Θ I be drawn parallel to AB. Now if EB be bisected, and the half be bisected, and so on continually, there will be left some line less than $I\Theta$; [let EK be less than

tion necessary to produce equilibrium, so that Z remains depressed. Therefore (A+B) is not greater than the magnitude necessary to produce equilibrium; in the same way it can be proved not to be less; therefore it is equal.

^b The centres of gravity of a triangle and a trapezium are also found by Archimedes in the first book; the second book is wholly devoted to finding the centres of gravity of a parabolic segment and of a portion of it cut off by a parallel to the base.

τᾶς $I\Theta$ · καὶ διηρήσθω έκατέρα τᾶν AE, EB εἰς τὰς τῷ EK ἴσας, καὶ ἀπὸ τῶν κατὰ τὰς διαιρέσιας

σαμείων ἄχθωσαν παρὰ τὰν ΕΖ. διαιρεθήσεται δή τὸ ὅλον παραλληλόγραμμον εἰς παραλληλόγραμμα τὰ ἴσα καὶ ὁμοῖα τῶ ΚΖ. τῶν οὖν παραλληλογράμμων τῶν ἴσων καὶ δμοίων τῶ ΚΖ ἐφαρμοζομένων έπ' άλλαλα καὶ τὰ κέντρα τοῦ βάρεος αὐτῶν έπ' ἄλλαλα πεσοῦνται. Εσσοῦνται δὴ μεγέθεά τινα, παραλληλόγραμμα ίσα τῶ ΚΖ, ἄρτια τῶ πλήθει, καὶ τὰ κέντρα τοῦ βάρεος αὐτῶν ἐπ' εὐθείας κείμενα, καὶ τὰ μέσα ἴσα, καὶ πάντα τὰ ἐφ' έκάτερα τῶν μέσων αὐτά τε ἴσα ἐντὶ καὶ αἱ μεταξὺ των κέντρων εὐθεῖαι ἴσαι τοῦ ἐκ πάντων αὐτῶν άρα συγκειμένου μεγέθεος τὸ κέντρον ἐσσεῖται τοῦ βάρεος ἐπὶ τᾶς εὐθείας τᾶς ἐπιζευγγυούσας τὰ κέντρα τοῦ βάρεος τῶν μέσων χωρίων, οὐκ ἔστι δέ τὸ γὰρ Θ ἐκτός ἐστι τῶν μέσων παραλληλογράμμων, φανερον οὖν, ὅτι ἐπὶ τᾶς ΕΖ εὐθείας τὸ κέντρον ἐστὶ τοῦ βάρεος τοῦ ΑΒΓΔ παραλληλονράμμου.

Παντὸς παραλληλογρήμμου τὸ κέντρον τοῦ βάρεός ἐστι τὸ σαμεῖον, καθ' ὁ αἱ διαμέτροι συμπίπτοντι.

Iθ,] and let each of AE, EB be divided into parts equal to EK, and from the points of division let straight lines be drawn parallel to EZ; then the whole parallelogram will be divided into parallelograms equal and similar to KZ. Therefore, if these parallelograms equal and similar to KZ be applied to each other, their centres of gravity will also coincide [Post. 4]. Thus there will be a set of magnitudes, being parallelograms equal to KZ, which are even in number and whose centres of gravity lie on a straight line, and the middle magnitudes will be equal, and the magnitudes on either side of the middle magnitudes will also be equal, and the straight lines between their centres [of gravity] will be equal; therefore the centre of gravity of the magnitude compounded of them all will be on the straight line joining the centres of gravity of the middle areas [Prop. 5, coroll. 2]. But it is not; for θ lies without the middle parallelograms. It is therefore manifest that the centre of gravity of the parallelogram $AB\Gamma\Delta$ will be on the straight line EZ.

Prop. 10

The centre of gravity of any parallelogram is the point in which the diagonals meet.

μαθήμασιν κατὰ τὸ ὑποπῖπτον θεωρίαν τετιμηκότα εδοκίμασα γράψαι σοι καὶ εἰς τὸ αὐτὸ βιβλίον εἰςορίσαι τρόπου τινὸς ἰδιότητα, καθ' ὅν σοι παρεχόμενον ἔσται λαμβάνειν ἀφορμὰς εἰς τὸ δύνασθαί τινα τῶν ἐν τοῖς μαθήμασι θεωρεῖν διὰ τῶν μηχανικῶν. τοῦτο δὲ πέπεισμαι χρήσιμον εἶναι οὐδὲν ἦσσον καὶ εἰς τὴν ἀπόδειξιν αὐτῶν τῶν θεωρημάτων. καὶ γάρ τινα τῶν πρότερον μοι φανέντων μηχανικῶς ὕστερον γεωμετρικῶς ἀπεδείχθη διὰ τὸ χωρὶς ἀποδείξεως εἶναι τὴν διὰ τούτου τοῦ τρόπου θεωρίαν· ἐτοιμότερον γάρ ἐστι προλαβόντα διὰ τοῦ τρόπου γνῶσίν τινα τῶν ζητημάτων πορίσασθαι τὴν ἀπόδειξιν μᾶλλον ἢ μηδενὸς ἐγνωσμένου ζητεῖν. . . . γράφομεν οὖν πρῶτον τὸ καὶ πρῶτον φανὲν διὰ τῶν μηχανικῶν, ὅτι πᾶν τμῆμα ὀρθογωνίου κώνου τομῆς ἐπίτριτόν ἐστιν τριγώνου τοῦ βάσιν ἔχοντος τὴν αὐτὴν καὶ ὕψος ἴσον.

Ibid., Prop. 1, Archim. ed. Heiberg ii. 434. 14-438. 21

Έστω τμημα το ABΓ περιεχόμενον υπο εὐθείας της AΓ καὶ ὀρθογωνίου κώνου τομης της ABΓ, καὶ τετμήσθω δίχα ἡ AΓ τῷ Δ, καὶ παρὰ τὴν διάμετρον ἤχθω ἡ ΔΒΕ, καὶ ἐπεζεύχθωσαν αἱ AB, BΓ.

Λέγω, ὅτι ἐπίτριτόν ἐστιν τὸ ΑΒΓ τμῆμα τοῦ

ΑΒΓ τριγώνου.

"Ηχθωσαν ἀπὸ τῶν Α, Γ σημείων ἡ μὲν ΑΖ παρὰ τὴν ΔΒΕ, ἡ δὲ ΓΖ ἐπιψαύουσα τῆς τομῆς, καὶ ἐκβεβλήσθω ἡ ΓΒ ἐπὶ τὸ Κ, καὶ κείσθω τῆ ΓΚ ἴση ἡ ΚΘ. νοείσθω ζυγὸς ὁ ΓΘ καὶ μέσον 222

who gives due honour to mathematical inquiries when they arise, I have thought fit to write out for you and explain in detail in the same book the peculiarity of a certain method, with which furnished vou will be able to make a beginning in the investigation by mechanics of some of the problems in mathematics. I am persuaded that this method is no less useful even for the proof of the theorems themselves. For some things first became clear to me by mechanics, though they had later to be proved geometrically owing to the fact that investigation by this method does not amount to actual proof; but it is, of course, easier to provide the proof when some knowledge of the things sought has been acquired by this method rather than to seek it with no prior knowledge. . . . At the outset therefore I will write out the very first theorem that became clear to me through mechanics, that any segment of a section of a right-angled cone is four-thirds of the triangle having the same base and equal height.

Ibid., Prop. 1, Archim. ed. Heiberg ii. 434. 14-438. 21

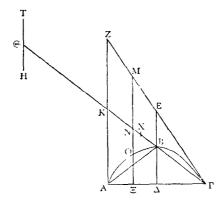

Let $\Lambda B\Gamma$ be a segment bounded by the straight line $\Lambda\Gamma$ and the section $AB\Gamma$ of a right-angled cone, and let $\Lambda\Gamma$ be bisected at Δ , and let ΔBE be drawn parallel to the axis, and let AB, $B\Gamma$ be joined.

I say that the segment ABI' is four-thirds of the triangle ABI'.

From the points A, Γ let AZ be drawn parallel to Δ BE, and let Γ Z be drawn to touch the section, and let Γ B be produced to K, and let $K\Theta$ be placed equal to Γ K. Let $\Gamma\Theta$ be imagined to be a balance

αὐτοῦ τὸ Κ καὶ τῆ ΕΔ παράλληλος τυχοῦσα ἡ ΜΞ.

Έπεὶ οὖν παραβολή ἐστιν ἡ ΓΒΑ, καὶ ἐφάπτεται

ή ΓΖ, καὶ τεταγμένως ἡ ΓΔ, ἴση ἐστὶν ἡ ΕΒ τῆ $\rm BΔ \cdot τοῦτο$ γὰρ ἐν τοῖς στοιχείοις δείκνυται· διὰ δὴ τοῦτο, καὶ διότι παράλληλοί εἰσιν αἱ ΖΑ, ΜΞ τῆ $\rm EΔ$, ἴση ἐστὶν καὶ ἡ μὲν MN τῆ NΞ, ἡ δὲ ΖΚ τῆ $\rm KA$. καὶ ἐπεί ἐστιν, ὡς ἡ ΓΑ πρὸς ΑΞ, οὕτως ἡ ΜΞ πρὸς $\rm EO$ [τοῦτο γὰρ ἐν λήμματι δείκνυται], ὡς δὲ ἡ ΓΑ πρὸς ΑΞ, οὕτως ἡ ΓΚ πρὸς ΚΝ, καὶ ἴση ἐστὶν ἡ ΓΚ τῆ $\rm KΘ$, ὡς ἄρα ἡ $\rm ΘΚ$ πρὸς $\rm KN$, οὕτως ἡ $\rm MΞ$ πρὸς $\rm EO$. καὶ ἐπεὶ τὸ $\rm N$ σημεῖον κέντρον τοῦ βάρους τῆς $\rm MΞ$ εὐθείας ἐστίν, ἐπείπερ ἴση ἐστὶν ἡ $\rm MN$ τῆ $\rm NΞ$, ἐὰν ἄρα τῆ $\rm EO$ ἴσην θῶμεν τὴν $\rm TH$ καὶ κέντρον τοῦ βάρους αὐτῆς τὸ $\rm Θ$, ὅπως ἴση ἢ ἡ $\rm TΘ$ τῆ $\rm ΘH$, ἰσορροπήσει ἡ $\rm TΘH$ τῆ $\rm MΞ$ αὐτοῦ μενούση διὰ τὸ ἀντιπεπονθότως τετμῆσθαι 224

with mid-point K, and let $M\Xi$ be drawn parallel to $E\Delta$.

Then since ΓBA is a parabola,^a and ΓZ touches it, and $\Gamma \Delta$ is a semi-ordinate, $EB = B\Delta$ —for this is proved in the elements ^b; for this reason, and because ZA, $M\Xi$ are parallel to $E\Delta$, $MN = N\Xi$ and ZK = KA [Eucl. vi. 4, v. 9]. And since

 $\Gamma A : A \Xi = M \Xi : \Xi O$, [Quad. parab. 5,

Eucl. v. 18

and $\Gamma A : A \Xi = \Gamma K : KN$, [Eucl. vi. 2, v. 18]

while $\Gamma K = K\Theta$,

therefore $\Theta K : KN = M\Xi : \Xi O$.

And since the point N is the centre of gravity of the straight line M Ξ , inasmuch as MN = N Ξ [Lemma 4], if we place TH = Ξ O, with Θ for its centre of gravity, so that T Θ = Θ H [Lemma 4], then T Θ H will balance M Ξ in its present position, because Θ N is cut

^a Archimedes would have said "section of a right-angled cone"—ὀρθογωνίου κώνου τομά.

b The reference will be to the *Elements of Conics* by Euclid and Aristaeus for which v. vol. i. pp. 486-491 and *infra*, p. 280 n. a; cf. similar expressions in *On Conoids and Spheroids*, Prop. 3 and *Quadrature of a Parabola*, Prop. 3; the theorem is *Quadrature of a Parabola*, Prop. 2.

¹ τοῦτο . . . δείκνυται om. Heiberg. It is probably an interpolator's reference to a marginal lemma.

την ΘΝ τοις ΤΗ, ΜΞ βάρεσιν, καὶ ώς την ΘΚ πρός ΚΝ, ούτως την ΜΕ πρός την ΗΤ. ώστε τοῦ έξ ἀμφοτέρων βάρους κέντρον ἐστὶν τοῦ βάρους τὸ Κ. ὁμοίως δὲ καί, ὅσαι ἂν ἀχθῶσιν ἐν τῷ ΖΑΓ τριγώνω παράλληλοι τῆ ΕΔ, ἶσορροπήσουσιν αὐτοῦ μένουσαι ταῖς ἀπολαμβανομέναις ἀπ' αὐτῶν ύπὸ τῆς τομῆς μετενεχθείσαις ἐπὶ τὸ Θ, ὥστε είναι τοῦ ἐξ ἀμφοτέρων κέντρον τοῦ βάρους τὸ Κ. καὶ ἐπεὶ ἐκ μὲν τῶν ἐν τῶ ΓΖΑ τριγώνω τὸ ΓΖΑ τρίνωνον συνέστηκεν, εκ δε των εν τη τομη όμοίως τη ΕΟ λαμβανομένων συνέστηκε το ΑΒΓ τμημα, ισορροπήσει ἄρα τὸ ΖΑΓ τρίγωνον αὐτοῦ μένον τω τμήματι της τομης τεθέντι περί κέντρον τοῦ βάρους τὸ Θ κατὰ τὸ Κ σημεῖον, ὥστε τοῦ ἐξ άμφοτέρων κέντρον είναι τοῦ βάρους τὸ Κ. τετμήσθω δή ή ΓΚ τῶ Χ, ὥστε τριπλασίαν είναι την ΓΚ της ΚΧ. έσται άρα το Χ σημείον κέντρον βάρους τοῦ ΑΖΓ τριγώνου δέδεικται γὰρ ἐν τοῖς Ισορροπικοῖς. ἐπεὶ οὖν ἰσόρροπον τὸ ΖΑΓ τρίγωνον αὐτοῦ μένον τῷ ΒΑΓ τμήματι κατὰ τὸ Κ τεθέντι περί τὸ Θ κέντρον τοῦ βάρους, καί ἐστιν τοῦ ΖΑΓ τριγώνου κέντρον βάρους τὸ Χ, ἔστιν άρα, ώς τὸ ΑΖΓ τρίγωνον πρὸς τὸ ΑΒΓ τμημα κείμενον περί τὸ Θ κέντρον, οὕτως ή ΘΚ πρὸς ΧΚ. τριπλασία δέ έστιν ή ΘΚ τῆς ΚΧ. τριπλάσιον ἄρα καὶ τὸ ΑΖΓ τρίγωνοι τοῦ ΑΒΓ τμήματος. ἔστι δὲ καὶ τὸ ΖΑΓ τρίγωνον τετραπλάσιον τοῦ ΑΒΓ τριγώνου διὰ τὸ ἴσην είναι τὴν μέν ΖΚ τη ΚΑ, την δέ ΑΔ τη ΔΓ επίτριτον ἄρα έστιν τὸ ΑΒΓ τμήμα τοῦ ΑΒΓ τριγώνου. Γτοῦτο οὖν φανερόν έστιν].1

¹ τοῦτο . . . ἐστιν om. Heiberg.

in the inverse proportion of the weights TH, MΞ,

and $\Theta K : KN = M\Xi : HT$;

therefore the centre of gravity of both [TH, ME] taken together is K. In the same way, as often as parallels to E Δ are drawn in the triangle ZAT, these parallels, remaining in the same position, will balance the parts cut off from them by the section and transferred to Θ , so that the centre of gravity of both together is K. And since the triangle TZA is composed of the [straight lines drawn in FZA, and the segment ABT is composed of the lines in the section formed in the same way as ΞO , therefore the triangle $ZA\Gamma$ in its present position will be balanced about K by the segment of the section placed with θ for its centre of gravity, so that the centre of gravity of both combined is K. Now let ΓK be cut at X so that $\Gamma K = 3KX$: then the point X will be the centre of gravity of the triangle AZI; for this has been proved in the books On Equilibriums.^a Then since the triangle ZA Γ in its present position is balanced about K by the segment BAT placed so as to have θ for its centre of gravity, and since the centre of gravity of the triangle $ZA\Gamma$ is X, therefore the ratio of the triangle $AZ\Gamma$ to the segment ABT placed about θ as its centre [of gravity] is equal to $\Theta K : XK$. But $\Theta K = 3KX$; therefore

triangle AZI' = 3 . segment ABI'. And triangle ZA Γ = 4 . triangle ABI', because ZK = KA and $A\Delta = \Delta\Gamma$; therefore segment AB Γ = $\frac{4}{5}$ triangle AB Γ .

¹ τοῦτο . . . πρότερον. In the Ms. the whole paragraph from τοῦτο to πρότερον comes at the beginning of Prop. 2; it is more appropriate at the end of Prop. 1.

This, indeed, has not been actually demonstrated by the arguments now used, but they have given some indication that the conclusion is true; seeing, therefore, that the theorem is not demonstrated, but suspecting that the conclusion is true, we shall have recourse ^a to the geometrical proof which I myself discovered and have already published.^b

Archimedes, Quadrature of a Parabola, Preface, Archimed. Heiberg ii. 262, 2-266, 4

Archimedes to Dositheus greeting.

On hearing that Conon, who fulfilled in the highest degree the obligations of friendship, was dead, but that you were an acquaintance of Conon and also versed in geometry, while I grieved for the death of a friend and an excellent mathematician, I set myself the task of communicating to you, as I had determined to communicate to Conon, a certain geometrical theorem, which had not been investigated before, but has now been investigated by me, and which I first discovered by means of mechanics and later proved by means of geometry. Now some of those who in former times engaged in mathematics tried to find a rectilineal area equal to a given circle and to a given segment of a circle, and afterwards they tried to square the area bounded by the section

^a I have followed Heath's rendering of τάξομεν, which seems more probable than Heiberg's "suo loco proponemus," though it is a difficult meaning to extract from τάξομεν.

^b Presumably Quadr. Parab. 24, the second of the proofs now to be given. The theorem has not been demonstrated, of course, because the triangle and the segment may not be supposed to be composed of straight lines.

This seems to indicate that Archimedes had not at this time written his own book On the Measurement of a Circle. For attempts to square the circle, v. vol. i. pp. 308-347.

όλου τοῦ κώνου τομᾶς καὶ εὐθείας τετραγωνίζειν έπειρώντο λαμβάνοντες οὐκ εὐπαραχώρητα λήμματα, διόπερ αὐτοῖς ὑπὸ τῶν πλείστων οὐκ εύρισκόμενα ταῦτα κατεγνώσθεν. τὸ δὲ ὑπ' εὐθείας τε καὶ ὀρθογωνίου κώνου τομᾶς τμᾶμα περιεχόμενον οὐδένα τῶν προτέρων ἐγχειρήσαντα τετραγωνίζειν επιστάμεθα, δ δη νῦν ὑφ' άμῶν εὕρηται· δείκνυται γάρ, ὅτι πᾶν τμᾶμα περιεχόμενον ὑπὸ εὐθείας καὶ ὀρθογωνίου κώνου τομᾶς ἐπίτριτόν έστι τοῦ τριγώνου τοῦ βάσιν ἔχοντος τὰν αὐτὰν καὶ ΰψος ἴσον τῷ τμάματι λαμβανομένου τοῦδε τοῦ λήμματος ἐς τὰν ἀπόδειξιν αὐτοῦ τῶν ἀνίσων χωρίων τὰν ὑπεροχάν, ễ ὑπερέχει τὸ μεῖζον τοῦ έλάσσονος, δυνατόν είμεν αὐτὰν έαυτα συντιθεμέναν παντός ύπερέχειν τοῦ προτεθέντος πεπερασμένου χωρίου. κέχρηνται δὲ καὶ οἱ πρότερον γεωμέτραι τῷδε τῷ λήμματι τούς τε γὰρ κύκλους διπλασίονα λόγον έχειν ποτ' άλλάλους τῶν διαμέτρων ἀποδεδείχασιν αὐτῷ τούτῳ τῷ λήμματι χρωμένοι, καὶ τὰς σφαίρας ὅτι τριπλασίονα λόγον ἔχοντι ποτ' ἀλλάλας τᾶν διάμετρων, ἔτι δὲ καὶ ότι πάσα πυραμίς τρίτον μέρος έστι τοῦ πρίσματος τοῦ τὰν αὐτὰν βάσιν ἔχοντος τῷ πυραμίδι καὶ ὕψος ἴσον καὶ διότι πᾶς κῶνος τρίτον μέρος ἐστὶ τοῦ κυλίνδρου τοῦ τὰν αὐτὰν βάσιν ἔχοντος τῷ κώνῳ καὶ ὕψος ἴσον, ὁμοῖον τῷ προειρημένῳ λῆμμά τι λαμβάνοντες έγραφον. συμβαίνει δε τῶν προειρημένων θεωρημάτων έκαστον μηδενός ήσσον τῶν ἄνευ τούτου τοῦ λήμματος ἀποδεδειγμένων πεπιστευκέναι ἀρκεῖ δὲ ἐς τὰν ὁμοίαν πίστιν τούτοις άναγμένων των ύφ' άμων εκδιδομένων. άναγράψαντες οὖν αὐτοῦ τὰς ἀποδείξιας ἀποστέλλομες 230

of the whole cone and a straight line, a assuming lemmas far from obvious, so that it was recognized by most people that the problem had not been solved. But I do not know that any of my predecessors has attempted to square the area bounded by a straight line and a section of a right-angled cone, the solution of which problem I have now discovered; for it is shown that any segment bounded by a straight line and a section of a right-angled cone is four-thirds of the triangle which has the same base and height equal to the segment, and for the proof this lemma is assumed: given [two] unequal areas, the excess by which the greater exceeds the less can, by being added to itself, be made to exceed any given finite area. Earlier geometers have also used this lemma: for, by using this same lemma, they proved that circles are to one another in the duplicate ratio of their diameters, and that spheres are to one another in the triplicate ratio of their diameters, and also that any pyramid is a third part of the prism having the same base as the pyramid and equal height; and, further, by assuming a lemma similar to that aforesaid, they proved that any cone is a third part of the cylinder having the same base as the cone and equal height.^b In the event, each of the aforesaid theorems has been accepted, no less than those proved without this lemma; and it will satisfy me if the theorems now published by me obtain the same degree of acceptance. I have therefore written out the proofs, and now send them, first

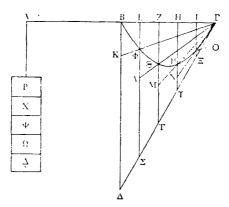

^a A "section of the whole cone" is probably a section cutting right through it, *i.e.*, an ellipse, but the expression is odd.

Let BOF be a segment bounded by a straight line and a section of a right-angled cone. First let BF be at right angles to the axis, and from B let $B\Delta$ be drawn parallel to the axis, and from Γ let $\Gamma\Delta$ be drawn touching the section of the cone at Γ ; then the triangle BF Δ will be right-angled [Eucl. i. 29]. Let BF be divided into any number of equal segments BE, EZ, ZH, HI, HF, and from the points of section let E Σ , ZT, HY, I Ξ be drawn parallel to the axis, and from the points in which these cut the

αδται τὰν τοῦ κώνου τομάν, ἐπεζεύχθωσαν ἐπὶ τὸ Γ καὶ ἐκβεβλήσθωσαν, φαμὶ δὴ τὸ τρίγωνον τὸ ΒΔΓ τῶν μὲν τραπεζίων τῶν ΚΕ, ΛΖ, ΜΗ, ΝΙ καὶ τοῦ ΞΙΓ τριγώνου ἔλασσον είμεν ἢ τριπλάσιον. τῶν δὲ τραπεζίων τῶν ΖΦ, ΗΘ, ΙΠ καὶ τοῦ

ΙΟΓ τριγώνου μεῖζόν [ἐστιν]ι ἢ τριπλάσιον.

Διάχθω γὰρ εὐθεῖα ὁ ΑΒΓ, καὶ ἀπολελάφθω ὁ ΑΒ ἴσα τὰ ΒΓ, καὶ νοείσθω ζύγιον τὸ ΑΓ΄ μέσον δὲ αὐτοῦ ἐσσεῖται τὸ Β. καὶ κρεμάσθω ἐκ τοῦ Β, κρεμάσθω δὲ καὶ τὸ ΒΔΓ ἐκ τοῦ ζυγοῦ κατὰ τὰ Β, Γ, ἐκ δὲ τοῦ θατέρου μέρεος τοῦ ζυγοῦ κρεμάσθω τὰ Ρ, Χ, Ψ, Ω, Δ χωρία κατὰ τὸ Α, καὶ ἰσορροπείτω τὸ μὲν P χωρίον τῷ ΔE τραπεζίω οὕτως ἔχοντι, τὸ δὲ X τῷ $Z\Sigma$ τραπεζίω, τὸ δὲ Ψ τῶ ΤΗ, τὸ δὲ Ω τῶ ΥΙ, τὸ δὲ Δ τῶ ΞΙΓ τριγώνω. ισορροπήσει δη και το όλον τω όλω. ώστε τριπλάσιον ἂν είη τὸ ΒΔΓ τρίγωνον τοῦ ΡΧΨΩΔ χωρίου. καὶ ἐπεί ἐστιν τμᾶμα τὸ ΒΓΘ, δ περιέχεται ύπό τε εὐθείας καὶ ὀρθογωνίου κώνου τομᾶς. καὶ ἀπὸ μὲν τοῦ Β παρὰ τὰν διάμετρον ἄκται ἁ ΒΔ, ἀπὸ δὲ τοῦ Γ ἁ ΓΔ ἐπιψαύουσα τᾶς τοῦ κώνου τομας κατά τὸ Γ, ἄκται δέ τις καὶ ἄλλα παρὰ τὰν διάμετρον ά ΣΕ, τὸν αὐτὸν ἔχει λόγον ά ΒΓ ποτὶ τὰν ΒΕ, δν ά ΣΕ ποτὶ τὰν ΕΦ. ὥστε καὶ ά ΒΑ ποτὶ τὰν ΒΕ τὸν αὐτὸν ἔχει λόγον, δν τὸ ΔΕ τραπέζιον ποτὶ τὸ ΚΕ. ὁμοίως δὲ δειχθήσεται ά ΑΒ ποτί τὰν ΒΖ τὸν αὐτὸν ἔχουσα λόγον, ον το ΣΖ τραπέζιον ποτί το ΛΖ, ποτί δε ταν ΕΗ. ον τὸ ΤΗ ποτὶ τὸ ΜΗ, ποτὶ δὲ τὰν ΒΙ, ον τὸ ΥΙ ποτί τὸ ΝΙ. ἐπεί οὖν ἐστι τραπέζιον τὸ ΔΕ τὰς

¹ ἐστιν om. Heiberg.

section of the cone let straight lines be drawn to Γ and produced. Then I say that the triangle $B\Delta\Gamma$ is less than three times the trapezia KE, ΛZ , MH, NI and the triangle $\Xi I\Gamma$, but greater than three times the trapezia $Z\Phi$, $H\theta$, III and the triangle $IO\Gamma$.

For let the straight line ABΓ be drawn, and let AB be cut off equal to $B\Gamma$, and let $A\Gamma$ be imagined to be a balance; its middle point will be B; let it be suspended from B, and let the triangle $B\Delta\Gamma$ be suspended from the balance at B, I', and from the other part of the balance let the areas P, X, Ψ , Ω , Δ be suspended at A, and let the area P balance the trapezium ΔE in this position, let X balance the trapezium Z Σ , let Ψ balance TII, let Ω balance YI, and let Δ balance the triangle $\Xi I\Gamma$; then the whole will balance the whole; so that the triangle $B\Delta\Gamma$ will be three times the area $P + X + \Psi + \Omega + \Delta$ [Prop. 6]. And since BI Θ is a segment bounded by a straight line and a section of a right-angled cone, and B∆ has been drawn from B parallel to the axis, and $\Gamma\Delta$ has been drawn from Γ touching the section of a cone at Γ, and another straight line ΣE has been drawn parallel to the axis,

 $B\Gamma : BE = \Sigma E : E\Phi ;$ [Prop. 5

therefore BA: BE = trapezium ΔE : trapezium KE.^a Similarly it may be proved that

AB: $BZ = \Sigma Z : AZ$, AB: BH = TH : MH, AB: BI = YI : NI.

Therefore, since ΔE is a trapezium with right angles

[•] For BA = BT and $\Delta E : KE = \Sigma E : E\Phi$.

μέν ποτί τοις Β, Ε σαμείοις γωνίας όρθας έχον, τὰς δὲ πλευρὰς ἐπὶ τὸ Γ νευούσας, ἰσορροπεῖ δέ τι χωρίον αὐτῷ τὸ Ρ κρεμάμενον ἐκ τοῦ ζυγοῦ κατὰ τὸ Α οὕτως ἔχοντος τοῦ τραπεζίου, ώς νῦν κείται, καὶ ἔστιν, ώς ά ΒΑ ποτὶ τὰν ΒΕ, οὕτως τὸ ΔΕ τραπέζιον ποτὶ τὸ ΚΕ, μεῖζον ἄρα ἐστὶν τὸ ΚΕ χωρίον τοῦ Ρ χωρίου δέδεικται γὰρ τοῦτο. πάλιν δὲ καὶ τὸ ΖΣ τραπέζιον τὰς μὲν ποτὶ τοῖς Ζ. Ε γωνίας δρθάς έγον, τὰν δὲ ΣΤ΄ νεύουσαν ἐπὶ τὸ Γ, ἰσορροπεί δὲ αὐτῷ χωρίον τὸ Χ ἐκ τοῦ ζυγοῦ · κρεμάμενον κατὰ τὸ Α΄ οὕτως ἔχοντος τοῦ τραπεζίου, ώς νθν κείται, καὶ ἔστιν, ώς μεν ά ΑΒ ποτὶ τὰν ΒΕ, οὕτως τὸ ΖΣ τραπέζιον ποτὶ τὸ ΖΦ, ὡς δὲ ά ΑΒ ποτὶ τὰν ΒΖ, οὕτως τὸ ΖΣ τραπέζιον ποτὶ τὸ ΛΖ εἴη οὖν κα τὸ Χ χωρίον τοῦ μὲν ΛΖ τραπεζίου έλασσον, τοῦ δὲ ΖΦ μεῖζον δέδεικται γάρ καὶ τοῦτο. διὰ τὰ αὐτὰ δὴ καὶ τὸ Ψ χωρίον τοῦ μὲν ΜΗ τραπεζίου ἔλασσον, τοῦ δὲ ΘΗ μεῖζον, καὶ τὸ Ω χωρίον τοῦ μὲν ΝΟΙΗ τραπεζίου ἔλασσον, τοῦ δὲ ΠΙ μεῖζον, όμοίως δὲ καὶ τὸ Δ΄ χωρίον τοῦ μέν ΕΙΓ τριγώνου έλασσον, τοῦ δὲ ΓΙΟ μείζον. έπεὶ οὖν τὸ μὲν ΚΕ τραπέζιον μεῖζόν ἐστι τοῦ Ρ χωρίου, τὸ δὲ ΛΖ τοῦ Χ, τὸ δὲ ΜΗ τοῦ Ψ, τὸ δὲ ΝΙ τοῦ Ω, τὸ δὲ ΞΙΓ τρίγωνον τοῦ Δ, φανερόν, ότι καὶ πάντα τὰ εἰρημένα χωρία μείζονά ἐστι τοῦ ΡΧΨΩΔ χωρίου. ἔστιν δὲ τὸ ΡΧΨΩΔ τρίτον μέρος τοῦ $\dot{B}\dot{\Gamma}\Delta$ τριγώνου· δῆλον ἄρα, ὅτι τὸ $\dot{B}\dot{\Gamma}\Delta$ τρίγωνον ἔλασσόν ἐστιν ἢ τριπλάσιον τῶν ΚΕ, ΛΖ, ΜΗ, ΝΙ τραπεζίων καὶ τοῦ ΞΙΓ τριγώνου. πάλιν, έπει τὸ μεν ΖΦ τραπέζιον έλασσόν έστι τοῦ Χ΄ χωρίου, τὸ δὲ ΘΗ τοῦ Ψ', τὸ δὲ ΙΠ τοῦ Ω. τὸ δὲ ΙΟΓ τρίγωνον τοῦ Δ, φανερόν, ὅτι καὶ πάντα 236

at the points B, E and with sides converging on I', and it balances the area P suspended from the balance at A, if the trapezium be in its present position, while

$$BA : BE = \Delta E : KE$$

therefore

$$KE > P$$
;

for this has been proved [Prop. 10]. Again, since $Z\Sigma$ is a trapezium with right angles at the points Z, E and with ΣT converging on Γ , and it balances the area X suspended from the balance at A, if the trapezium be in its present position, while

$$AB : BE = Z\Sigma : Z\Phi$$
,

$$AB : BZ = Z\Sigma : \Lambda Z$$

therefore

$$\Lambda Z > X > Z\Phi$$
;

for this also has been proved [Prop. 12]. By the same reasoning

$$MH > \Psi > \Theta H$$
,

and

$$\text{NOIH} > \Omega > \Pi \text{II}$$

and similarly

$$\Xi \Pi > \frac{1}{2} > \Pi 0.$$

Then, since KE>P, Λ Z>X, MH> Ψ , NI> Ω , Ξ H'> $\frac{1}{2}$, it is clear that the sum of the aforesaid areas is greater than the area $P + X + \Psi + \Omega + \frac{1}{2}$. But

$$P + X + \Psi + \Omega + \Delta = \frac{1}{5} B\Gamma \Delta$$
; [Prop. 6]

it is therefore plain that

$$B\Gamma\Delta < 3(KE + \Delta Z + MH + NI + \Xi II')$$
.

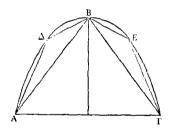

Again, since $Z\Phi < X$, $OH < \Psi$, $III < \Omega$, $IO\Gamma < \frac{\Lambda}{5}$, it is 287

τὰ εἰρημένα ἐλάσσονά ἐστι τοῦ ΔΩΨΧ χωρίου· φανερὸν οὖν, ὅτι καὶ τὸ ΒΔΓ τρίγωνον μεῖζόν ἐστιν ἢ τριπλάσιον τῶν ΦΖ, ΘΗ, ΙΠ τραπεζίων καὶ τοῦ ΙΓΟ τριγώνου, ἔλασσον δὲ ἢ τριπλάσιον τῶν προγεγραμμένων.

Ibid., Prop. 24, Archim. ed. Heiberg ii. 312, 2–314, 27

Πᾶν τμᾶμα τὸ περιεχόμενον ὑπὸ εὐθείας καὶ ὀρθογωνίου κώνου τομᾶς ἐπίτριτόν ἐστι τριγώνου τοῦ τὰν αὐτὰν βάσιν ἔχοντος αὐτῷ καὶ ὕψος ἴσον.

Έστω γὰρ τὸ ΑΔΒΕΓ τμᾶμα περιεχόμενον ὑπὸ εὐθείας καὶ ὀρθογωνίου κώνου τομᾶς, τὸ δὲ ΑΒΙ τρίγωνον ἔστω τὰν αὐτὰν βάσιν ἔχον τῷ τμάματι

καὶ ὕψος ἴσον, τοῦ δὲ ΑΒΓ τριγώνου ἔστω ἐπίτριτον τὸ Κ χωρίον. δεικτέον, ὅτι ἴσον ἐστὶ τῷ

ΑΔΒΕΓ τμάματι.

Εἰ γὰρ μή ἐστιν ἴσον, ἤτοι μεῖζόν ἐστιν ἢ ἔλασσον. ἔστω πρότερον, εἰ δυνατόν, μεῖζον τὸ ΑΔΒΕΓ τμᾶμα τοῦ Κ χωρίου. ἐνέγραψα δὴ τὰ ΑΔΒ, ΒΕΓ τρίγωνα, ὡς εἴρηται, ἐνέγραψα δὲ καὶ εἰς τὰ περιλειπόμενα τμάματα ἄλλα τρίγωνα τὰν αὐτὰν 238

clear that the sum of the aforesaid areas is greater than the area $\underline{\lambda}+\Omega+\Psi+X$;

it is therefore manifest that

$$B\Delta\Gamma > 3(\Phi Z + \Theta H + III + I\Gamma O),^a$$

but is less than thrice the aforementioned areas.^b

Ibid., Prop. 24, Archim. ed. Heiberg ii. 312. 2-314. 27

Any segment bounded by a straight line and a section of a right-angled cone is four-thirds of the triangle

having the same base and equal height.

For let $\Lambda\Delta$ BE Γ be a segment bounded by a straight line and a section of a right-angled cone, and let AB Γ be a triangle having the same base as the segment and equal height, and let the area K be four-thirds of the triangle AB Γ . It is required to prove that it is equal to the segment $\Lambda\Delta$ BE Γ .

For if it is not equal, it is either greater or less. Let the segment $A\Delta BE\Gamma$ first be, if possible, greater than the area K. Now I have inscribed the triangles $A\Delta B$, $BE\Gamma$, as aforesaid, and I have inscribed in the remaining segments other triangles having the same

• For $B\Delta\Gamma = 3(P + X + \Psi + \Omega + \Delta) > 3(\Delta + \Omega + \Psi + X)$.

 b In Prop. 15 Archimedes shows that the same theorem holds good even if BI is not at right angles to the axis. It is then proved in Prop. 16, by the method of exhaustion, that the segment is equal to one-third of the triangle BIA. This is done by showing, on the basis of the "Axiom of Archimedes," that by taking enough parts the difference between the circumscribed and the inscribed figures can be made as small as we please. It is equivalent to integration. From this it is easily proved that the segment is equal to four-thirds of a triangle with the same base and equal height (Prop. 17).

In earlier propositions Archimedes has used the same procedure as he now describes. Δ, E are the points in which the diameter through the mid-points of AB, BΓ meet the curve.

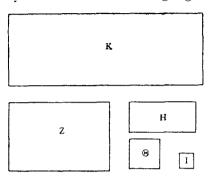

βάσιν ἔχοντα τοῖς τμαμάτεσσιν καὶ ὕψος τὸ αὐτό, καὶ ἀεὶ εἰς τὰ ὕστερον γινόμενα τμάματα έγγράφω δύο τρίγωνα τὰν αὐτὰν βάσιν ἔχοντα τοῖς τμαμάτεσσιν καὶ ὕψος τὸ αὐτό: ἐσσοῦνται δή τὰ καταλειπόμενα τμάματα ελάσσονα τᾶς ὑπεροχᾶς, δ ύπερέχει τὸ ΑΔΒΕΓ τμᾶμα τοῦ Κ χωρίου. ὥστε τὸ ἐγγραφόμενον πολύγωνον μεῖζον ἐσσεῖται τοῦ Κ. ὅπερ ἀδύνατον. ἐπεὶ γάρ ἐστιν έξῆς κείμενα χωρία εν τῷ τετραπλασίονι λόγω, πρῶτον μὲν τὸ ΑΒΓ τρίγωνον τετραπλάσιον τῶν ΑΔΒ, ΒΕΓ τριγώνων, έπειτα δέ αὐτὰ ταῦτα τετραπλάσια τῶν είς τὰ έπόμενα τμάματα έγγραφέντων καὶ ἀεὶ ούτω, δηλον, ώς σύμπαντα τὰ χωρία ἐλάσσονά έστιν η επίτριτα του μεγίστου, το δε Κ επίτριτόν έστι τοῦ μεγίστου χωρίου. οὐκ ἄρα ἐστὶν μεῖζον τὸ ΑΔΒΕΓ τμᾶμα τοῦ Κ χωρίου.

"Εστω δέ, εἰ δυνατόν, ἔλασσον. κείσθω δὴ τὸ μὲν ΑΒΓ τρίγωνον ἴσον τῷ Ζ, τοῦ δὲ Ζ τέταρτον τὸ Η, καὶ ὁμοίως τοῦ Η τὸ Θ , καὶ ἀεὶ έξ $\hat{\eta}$ ς τιθέσθω, ἕως κα γένηται τὸ ἔσχατον ἔλισσον τᾶς

$$\begin{array}{lll} 1 + (\frac{1}{4}) + (\frac{1}{4})^2 + & \dots & (\frac{1}{4})^{n-1} = & - & (\frac{1}{4})^{n-1} \\ & = & \frac{1 - (\frac{1}{4})}{1 - \frac{1}{4}} & & & \end{array}$$

^a This was proved geometrically in Prop. 23, and is proved generally in Fuel. ix. 35. It is equivalent to the summation

base as the segments and equal height, and so on continually I inscribe in the resulting segments two

triangles having the same base as the segments and equal height; then there will be left [at some time] segments less than the excess by which the segment $A\Delta BE\Gamma$ exceeds the area K [Prop. 20, coroll.]. Therefore the inscribed polygon will be greater than K; which is impossible. For since the areas successively formed are each four times as great as the next, the triangle $AB\Gamma$ being four times the triangles $A\Delta B$, $BE\Gamma$ [Prop. 21], then these last triangles four times the triangles inscribed in the succeeding segments, and so on continually, it is clear that the sum of all the areas is less than four-thirds of the greatest [Prop. 23], and K is equal to four-thirds of the greatest area. Therefore the segment $A\Delta BE\Gamma$ is not greater than the area K.

Now let it be, if possible, less. Then let

$$Z = AB\Gamma$$
, $H = \frac{1}{4}Z$, $\Theta = \frac{1}{4}H$,

and so on continually, until the last [area] is less than vol. II R 244

ύπεροχας, δι ύπερέχει τὸ Κ χωρίον τοῦ τμάματος, καὶ ἔστω ἔλασσον τὸ Ι. ἔστιν δὴ τὰ Ζ, Η, Θ, Ι χωρία καὶ τὸ τρίτον τοῦ Ι ἐπίτριτα τοῦ Ζ. ἔστιν δέ καὶ τὸ Κ τοῦ Ζ ἐπίτριτον ἴσον ἄρα τὸ Κ τοῖς Ζ, Η, Θ, Ι καὶ τῷ τρίτω μέρει τοῦ Ι. ἐπεὶ οὖν τό Κ χωρίον τῶν μὲν Ζ, Η, Θ, Ι χωρίων ὑπερέχει έλάσσονι τοῦ Ι, τοῦ δὲ τμάματος μείζονι τοῦ Ι, δηλον, ώς μείζονά έντι τὰ Ζ, Η, Θ, Ι χωρία τοῦ τμάματος ὅπερ ἀδύνατον ἐδείχθη γάρ, ὅτι, ἐὰν ή όποσαοῦν χωρία έξης κείμενα ἐν τετραπλασίονι λόγω, τὸ δὲ μέγιστον ἴσον ἢ τῷ εἰς τὸ τμᾶμα έγγραφομένω τριγώνω, τὰ σύμπαντα χωρία έλάσσονα έσσειται τοῦ τμάματος. οὐκ ἄρα το ΑΔΒΕΓ τμᾶμα ἔλασσόν έστι τοῦ ${\bf K}$ χωρίου. ἐδείχθη δέ, ότι οὐδὲ μεῖζον ἴσον ἄρα ἐστὶν τῷ Κ. το δὲ Κ χωρίον ἐπίτριτόν ἐστι τοῦ τριγώνου τοῦ ΑΒΓ. καί τὸ ${

(i.) Postulates

Archim. De Corpor. Fluit. i., Archim. ed. Heiberg ii. 318. 2-8

Υποκείσθω τὸ ύγρὸν φύσιν έχον τοιαύταν, ώστε των μερέων αὐτοῦ των έξ ἴσου κειμένων καὶ συν-

a The Greek text of the book On Floating Bodies, the earliest extant treatise on hydrostatics, first became available in 1906 when Heiberg discovered at Constantinople the Ms. which he terms C. Unfortunately many of the readings are doubtful, and those who are interested in the text should consult the Teubner edition. Still more unfortunately, it is incomplete; but, as the whole treatise was translated into Latin in 1269 by William of Moerbeke from a Greek Ms.

the excess by which the area K exceeds the segment [Eucl. x. 1], and let I be [the area] less [than this excess]. Now

 $Z + H + \theta + I + \frac{1}{3}I = \frac{1}{3}Z.$ [Prop. 23]

But $K = \frac{4}{3}Z$;

therefore $K = Z + H + \Theta + I + \frac{1}{2}I$.

Therefore since the area K exceeds the areas Z, H, θ , I by an excess less than I, and exceeds the segment by an excess greater than I, it is clear that the areas Z, H, θ , I are greater than the segment; which is impossible; for it was proved that, if there be any number of areas in succession such that each is four times the next, and the greatest be equal to the triangle inscribed in the segment, then the sum of the areas will be less than the segment [Prop. 22]. Therefore the segment $A\Delta BE\Gamma$ is not less than the area K. And it was proved not to be greater; therefore it is equal to K. But the area K is four-thirds of the triangle $AB\Gamma$; and therefore the segment $A\Delta BE\Gamma$ is four-thirds of the triangle $AB\Gamma$.

(k) Hydrostatics

(i.) Postulates

Archimedes, On Floating Bodies ^a i., Archim. ed. Heiberg ii. 318. 2-8

Let the nature of a fluid be assumed to be such that, of its parts which lie evenly and are continuous,

since lost, it is possible to supply the missing parts in Latin, as is done for part of Prop. 2. From a comparison with the Greek, where it survives, William's translation is seen to be so literal as to be virtually equivalent to the original. In each case Heiberg's figures are taken from William's translation, as they are almost unrecognizable in C; for convenience in reading the Greek, the figures are given the appropriate Greek letters in this edition.

εχέων ἐόντων ἐξωθεῖσθαι τὸ ἦσσον θλιβόμενον ὑπὸ τοῦ μᾶλλον θλιβομένου, καὶ ἔκαστον δὲ τῶν μερέων αὐτοῦ θλίβεσθαι τῷ ὑπεράνω αὐτοῦ ὑγρῷ κατὰ κάθετον ἐόντι, εἴ κα μὴ τὸ ὑγρὸν ἢ καθειργμένον ἔν τινι καὶ ὑπὸ ἄλλου τινὸς θλιβόμενον.

Ibid. i., Archim. ed. Heiberg ii. 336. 14-16

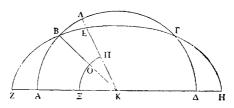

Υποκείσθω, τῶν ἐν τῷ ὑγρῷ ἄνω φερομένων ἔκαστον ἀναφέρεσθαι κατὰ τὰν κάθετον τὰν διὰ τοῦ κέντρου τοῦ βάρεος αὐτοῦ ἀγμέναν.

(ii.) Surface of Fluid at Rest

Ibid. i., Prop. 2, Archim. ed. Heiberg ii. 319, 7–320, 30

Omnis humidi consistentis ita, ut maneat inmotum, superficies habebit figuram sperae habentis centrum idem cum terra.

Intelligatur enim humidum consistens ita, ut maneat non motum, et secetur ipsius superficies plano per centrum terrae, sit autem terrae centrum K, superficiei autem sectio linea ABGD. Dico itaque,

lineam ABGD circuli esse periferiam, centrum autem ipsius \mathbf{K} .

Si enim non est, rectae a K ad lineam ABGD 244

that which is under the lesser pressure is driven along by that under the greater pressure, and each of its parts is under pressure from the fluid which is perpendicularly above it, except when the fluid is enclosed in something and is under pressure from something else.

Ibid. i., Archim. ed. Heiberg ii. 336. 14-16

Let it be assumed that, of bodies which are borne upwards in a fluid, each is borne upwards along the perpendicular drawn through its centre of gravity.^a

(ii.) Surface of Fluid at Rest

Ibid. i., Prop. 2, b Archim. ed. Heiberg ii. 319, 7–320, 30

The surface of any fluid at rest is the surface of a sphere having the same centre as the earth.

For let there be conceived a fluid at rest, and let its surface be cut by a plane through the centre of the earth, and let the centre of the earth be K, and let the section of the surface be the curve $AB\Gamma\Delta$. Then I say that the curve $AB\Gamma\Delta$ is an arc of a circle whose centre is K.

For if it is not, straight lines drawn from K to the

^a These are the only assumptions, other than the assumptions of Euclidean geometry, made in this book by Archimedes: if the object of mathematics be to base the conclusions on the fewest and most "self-evident" axioms, Archimedes' treatise (In Floating Bodies must indeed be ranked highly.

^b The earlier part of this proposition has to be given from William of Moerbeke's translation. The diagram is here

given with the appropriate Greek letters.

occurrentes non erunt aequales. Sumatur itaque aliqua recta, quae est quarundam quidem a K occurrentium ad lineam ABGD major, quarundam autem minor, et centro quidem K, distantia autem sumptae lineae circulus describatur; cadet igitur periferia circuli habens hoc quidem extra lineam ABGD, hoc autem intra, quoniam quae ex centro quarundam quidem a K occurrentium ad lineam ABGD est major, quarundam autem minor. Sit igitur descripti circuli periferia quae ZBH, et a B ad K recta ducatur, et copulentur quae ZK, KEL aequales facientes angulos, describatur autem et centro K periferia quaedam quae XOP in plano et in humido; partes itaque humidi quae secundum XOP periferiam ex aequo sunt positae et continuae inuicem. Et premuntur quae quidem secundum XO periferiam humido quod secundum ZB locum, quae secundum periferiam OP humido quod secundum BE locum; inaequaliter igitur premuntur partes humidi quae secundum periferiam XO ei quae [η] κατὰ τὰν ΟΠ. ὥστε έξωθήσονται τὰ ήσσον θλιβόμενα ύπὸ τῶν μᾶλλον θλιβομένων οὐ μένει άρα τὸ ὑγρόν. ὑπέκειτο δὲ καθεστακὸς εἶμεν ὥστε μένειν ακίνητον αναγκαῖον άρα τὰν ΑΒΓΔ γραμμαν κύκλου περιφέρειαν είμεν και κέντρον αυτας τὸ Κ. ὁμοίως δὴ δειχθήσεται καί, ὅπως κα ἄλλως ά ἐπιφάνεια τοῦ ὑγροῦ ἐπιπέδω τμαθῆ διὰ τοῦ κέντρου τᾶς γᾶς, ὅτι ά τομὰ ἐσσεῖται κύκλου περιφέρεια, καὶ κέντρον αὐτᾶς ἐσσεῖται, ο καὶ τᾶς γας έστι κέντρον. δηλον οδν, ότι ά επιφάνεια τοῦ ύγροῦ καθεστακότος ἀκινήτου σφαίρας έχει τὸ σχημα τὸ αὐτὸ κέντρον ἐχούσας τῷ γῷ, ἐπειδή

curve $AB\Gamma\Delta$ will not be equal. Let there be taken, therefore, any straight line which is greater than some of the straight lines drawn from K to the curve ABI Δ , but less than others, and with centre K and radius equal to the straight line so taken let a circle be described: the circumference of the circle will fall partly outside the curve ABIA, partly inside, inasmuch as its radii are greater than some of the straight lines drawn from K to the curve ABTA, but less than others. Let the arc of the circle so described beZBH, and from B let a straight line be drawn to K, and let ZK, KEA be drawn making equal angles [with KB], and with centre K let there be described, in the plane and in the fluid, an arc EOII; then the parts of the fluid along EOII lie evenly and are continuous [v. supra, p. 243]. And the parts along the are \(\mathbb{Z} \)O are under pressure from the portion of the fluid between it and ZB, while the parts along the arc OII are under pressure from the portion of the fluid between it and BE; therefore the parts of the fluid along EO and the parts of the fluid along OII are under unequal pressures; so that the parts under the lesser pressure are thrust along by the parts under the greater pressure [v. supra, p. 245]; therefore the fluid will not remain at rest. But it was postulated that the fluid would remain unmoved; therefore the curve ABI'∆ must be an arc of a circle with centre K. Similarly it may be shown that, in whatever other manner the surface be cut by a plane through the centre of the earth, the section is an arc of a circle and its centre will also be the centre of the earth. It is therefore clear that the surface of the fluid remaining at rest has the form of a sphere with the same centre as the earth, since it is such

τοιαύτα ἐστίν, ὥστε διὰ τοῦ αὐτοῦ σαμείου τμαθεῖσαν τὰν τομὰν ποιεῖν περιφέρειαν κύκλου κέντρον έγοντος τὸ σαμεῖον, δι' οῦ τέμνεται τῶ ἐπιπέδω.

(iii.) Solid immersed in a Fluid

Ibid. i., Prop. 7, Archim. ed. Heiberg ii, 332, 21-336, 13

Τὰ βαρύτερα τοῦ ύγροῦ ἀφεθέντα εἰς τὸ ύγρὸν οἰσεῖται κάτω, ἔστ' ἂν καταβᾶντι, καὶ ἐσσοῦνται κουφότερα έν τῷ ύγρῷ τοσοῦτον, ὅσον ἔχει τὸ βάρος τοῦ ύγροῦ τοῦ ταλικοῦτον ὄγκον ἔχοντος, άλίκος έστιν ο τοῦ στερεοῦ μεγέθεος ὄγκος.

"Οτι μεν οὖν οἰσεῖται ες τὸ κάτω, ἔστ' αν καταβᾶντι, δηλον τὰ γὰρ ὑποκάτω αὐτοῦ μέρεα τοῦ ύγροῦ θλιβησοῦνται μᾶλλον τῶν ἐξ ἴσου αὐτοῖς κειμένων μερέων, έπειδή βαρύτερον υπόκειται τὸ στερεον μέγεθος τοῦ ύγροῦ. ὅτι δὲ κουφότερα έσσουνται, ώς εἴρηται, δειχθήσεται.

"Εστω τι μέγεθος τὸ Α΄, ὅ ἐστι βαρύτερον τοῦ ύγροῦ, βάρος δὲ ἔστω τοῦ μὲν ἐν ὧ Λ μεγέθεος τὸ ΒΓ, τοῦ δὲ ὑγροῦ τοῦ ἴσον ὄγκον ἔχοντος τῷ Α τὸ Β. δεικτέον, ὅτι τὸ Α μένεθος ἐν τῶ ὑνρῶ

έὸν βάρος έξει ἴσον τῶ Γ.

Λελάφθω γάρ τι μέγεθος τὸ ἐν ὧ τὸ Δ κουφότερον τοῦ ύγροῦ τοῦ ἴσον ὄγκον ἔχοντος αὐτῷ, ἔστω δὲ τοῦ μὲν ἐν ῷ τὸ Δ μεγέθεος βάρος ἴσον τῶ Β βάρει, τοῦ δὲ ὑγροῦ τοῦ ἴσον ὄγκον ἔχουτος τῶ Δ μεγέθει τὸ βάρος ἔστω ἴσον τῶ ΒΓ βάρει.

a Or, as we should say, "lighter by the weight of fluid displaced."

that, when it is cut [by a plane] always passing through the same point, the section is an arc of a circle having for centre the point through which it is cut by the plane [Prop. 1].

(iii.) Solid immersed in a Fluid

Ibid. i., Prop. 7, Archim. ed. Heiberg ii. 332, 21-336, 13

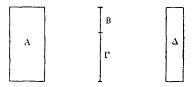

Solids heavier than a fluid will, if placed in the fluid, sink to the bottom, and they will be lighter [if weighed] in the fluid by the weight of a volume of the fluid equal to

the volume of the solid.

That they will sink to the bottom is manifest: for the parts of the fluid under them are under greater pressure than the parts lying evenly with them, since it is postulated that the solid is heavier than water; that they will be lighter, as aforesaid will be [thus] proved.

Let A be any magnitude heavier than the fluid, let the weight of the magnitude A be $B + \Gamma$, and let the weight of fluid having the same volume as A be B. It is required to prove that in the fluid the magnitude

A will have a weight equal to Γ .

For let there be taken any magnitude Δ lighter than the same volume of the fluid such that the weight of the magnitude Δ is equal to the weight B, while the weight of the fluid having the same volume as the magnitude Δ is equal to the weight $B+\Gamma$.

συντεθέντων δή ές τὸ αὐτὸ τῶν μεγεθέων, ἐν οίς τὰ Α, Δ, τὸ τῶν συναμφοτέρων μέγεθος ἰσοβαρές έσσεῖται τῷ ύγρῷ ἔστι γὰρ τῶν μεγεθέων συναμφοτέρων το βάρος ίσον συναμφοτέροις τοῖς βάρεσιν τῶ τε ΒΓ καὶ τῷ Β, τοῦ δὲ ὑγροῦ τοῦ ίσον ὄγκον ἔχοντος ἀμφοτέροις τοῖς μεγέθεσι τὸ βάρος ίσον έστι τοις αὐτοις βάρεσιν. ἀφεθέντων οὖν τῶν μεγεθέων ἐς τὸ ὑγρὸν ἰσορροπησοῦνται τῷ ὑγρῷ καὶ οὔτε εἰς τὸ ἄνω οἰσοῦνται οὔτε εἰς τὸ κάτω. διὸ τὸ μὲν ἐν ὧ Α μέγεθος οἰσεῖται ἐς τὸ κάτω καὶ τοσαύτα βία ὑπὸ τοῦ ἐν ῷ Δ μεγέθεος ανέλκεται ές τὸ ἄνω, τὸ δὲ ἐν ὧ Δ μέγεθος, ἐπεὶ κουφότερόν έστι τοῦ ύγροῦ, ἀνοισεῖται εἰς τὸ ἄνω τοσαύτα βία, όσον έστι το Γ βάρος δέδεικται γάρ, ότι τὰ κουφότερα τοῦ ύγροῦ μεγέθεα στερεὰ βιασθέντα ές τὸ ύγρὸν ἀναφέρονται τοσαύτα βία ές τὸ άνω, ὅσον ἐστὶ τὸ βάρος, ῷ βαρύτερόν ἐστι τοῦ μεγέθεος τὸ ὑγρὸν τὸ ἴσογκον τῷ μεγέθει. ἔστι δέ τῶ Γ βάρει βαρύτερον τοῦ Δ μεγέθεος τὸ ὑγρὸν τὸ ἴσον ὄγκον ἔχον τῷ Δ. δηλον οὖν, ὅτι καὶ τὸ ἐν ῶ Α μέγεθος ἐς τὸ κάτω οἰσεῖται τοσούτω βάρει, οσον έστι τὸ Γ.

Let w be the weight of the crown, and let w_1 and w_2 be the weights of gold and silver in it respectively, so that w =

 $w_1 + w_2$.

^a This proposition suggests a method, alternative to that given by Vitruvius (v. supra, pp. 36-39, especially p. 38 n. a), whereby Archimedes may have discovered the proportions of gold and silver in King Hiero's crown.

Take a weight w of gold and weigh it in a fluid, and let the loss of weight be P_1 . Then the loss of weight when a weight w_1 of gold is weighed in the fluid, and consequently the weight of fluid displaced, will be $\frac{w_1}{m}$. P_1 .

Then if we combine the magnitudes A, Δ , the combined magnitude will be equal to the weight of the same volume of the fluid; for the weight of the combined magnitudes is equal to the weight $(B + \Gamma) + B$, while the weight of the fluid having the same volume as both the magnitudes is equal to the same Therefore, if the [combined] magnitudes are placed in the fluid, they will balance the fluid, and will move neither upwards nor downwards [Prop. 3]; for this reason the magnitude A will move downwards, and will be subject to the same force as that by which the magnitude Δ is thrust upwards, and since Δ is lighter than the fluid it will be thrust upwards by a force equal to the weight Γ ; for it has been proved that when solid magnitudes lighter than the fluid are forcibly immersed in the fluid, they will be thrust upwards by a force equal to the difference in weight between the magnitude and an equal volume of the fluid [Prop. 6]. But the fluid having the same volume as Δ is heavier than the magnitude Δ by the weight Γ ; it is therefore plain that the magnitude A will be borne upwards by a force equal to Γ.a

Now take a weight w of silver and weigh it in the fluid, and let the loss of weight be P_2 . Then the loss of weight when a weight w_2 of silver is weighed in the fluid, and consequently the weight of fluid displaced, will be $\frac{w_2}{w}$. P_2 .

Finally, weigh the crown itself in the fluid, and let the loss of weight, and consequently the weight of fluid displaced, be P.

It follows that
$$\frac{w_1}{w} \cdot P_1 + \frac{w_2}{w} \cdot P_2 = P$$
, whence $\frac{w_1}{w_2} = \frac{P_2 - P}{P - P_1}$.

(iv.) Stability of a Paraboloid of Revolution

Ibid. ii., Prop. 2, Archim. ed. Heiberg ii. 348. 10-352. 19

Τὸ ὀρθὸν τμᾶμα τοῦ ὀρθογωνίου κωνοειδέος, ὅταν τὸν ἄξονα ἔχη μὴ μείζονα ἢ ἡμιόλιον τᾶς μέχρι τοῦ ἄξονος, πάντα λόγον ἔχον ποτὶ τὸ ὑγρὸν τῷ βάρει, ἀφεθὲν εἰς τὸ ὑγρὸν οὕτως, ὤστε τὰν βάσιν αὐτοῦ μὴ ἄπτεσθαι τοῦ ὑγροῦ, τεθὲν κεκλιμένον οὐ μενεῖ κεκλιμένον, ἀλλὰ ἀποκαταστασεῖται ὀρθόν. ὀρθὸν δὲ λέγω καθεστακέναι τὸ τοιοῦτο τμᾶμα, ὁπόταν τὸ ἀποτετμακὸς αὐτὸ ἐπίπεδον παρὰ τὰν ἐπιφάνειαν ἢ τοῦ ὑγροῦ.

"Εστω τμᾶμα ὀρθογωνίου κωνοειδέος, οΐον εἴρηται, καὶ κείσθω κεκλιμένον. δεικτέον, ὅτι οὐ μενεῖ,

άλλ' ἀποκαταστασεῖται ὀρθόν.

Τμαθέντος δὴ αὐτοῦ ἐπιπέδω διὰ τοῦ ἄξονος ορθῷ ποτὶ τὸ ἐπίπεδον τὸ ἐπὶ τᾶς ἐπιφανείας τοῦ ὑγροῦ τμάματος ἔστω τομὰ ὰ ΑΠΟΛ ὀρθογωνίον κώνου τομά, ἄξων δὲ τοῦ τμάματος καὶ διάμετρος τᾶς τομᾶς ὰ ΝΟ, τᾶς δὲ τοῦ ὑγροῦ ἐπιφανείας τομὰ ὰ ΙΣ. ἐπεὶ οὖν τὸ τμᾶμα οὐκ ἐστὶν ὀρθόν, οὐκ ᾶν εἴη παράλληλος ὰ ΑΛ τᾶ ΙΣ. ὤστε οὐ ποιήσει ὀρθὰν γωνίαν ὰ ΝΟ ποτὶ τὰν ΙΣ. ἄγθω

b In this technical term the "axis" is the axis of the

252

^a Writing of the treatise On Floating Bodies, Heath (H.G.M. ii. 94-95) justly says: "Book ii., which investigates fully the conditions of stability of a right segment of a paraboloid of revolution floating in a fluid for different values of the specific gravity and different ratios between the axis or height of the segment and the principal parameter of the generating parabola, is a veritable tour de force which must be read in full to be appreciated."

(iv.) Stability of a Paraboloid of Revolution a

Ibid. ii., Prop. 2, Archim. ed. Heiberg ii. 348. 10-352. 19

If there be a right segment of a right-angled conoid. whose axis is not greater than one-and-a-half times the line drawn as far as the axis, b and whose weight relative to the fluid may have any ratio, and if it be placed in the fluid in an inclined position in such a manner that its base do not touch the fluid, it will not remain inclined but will return to the upright position. I mean by returning to the upright position the figure formed when the plane cutting off the segment is parallel to the surface of the fluid.

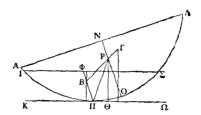

Let there be a segment of a right-angled conoid, such as has been stated, and let it be placed in an inclined position. It is required to prove that it will not remain there but will return to the upright

position.

Let the segment be cut by a plane through the axis perpendicular to the plane which forms the surface of the fluid, and let AIIOA be the section of the segment, being a section of a right-angled cone [De Con. et Sphaer. 11], and let NO be the axis of the segment and the axis of the section, and let $I\Sigma$ be the section of the surface of the liquid. Then since the segment is not upright, AA will not be parallel to $I\Sigma$; and therefore NO will not make a right angle

right-angled cone from which the generating parabola is derived. The latus rectum is "the line which is double of the line drawn as far as the axis" (á $\delta \iota \pi \lambda \alpha a (a \tau \hat{a} \hat{s} \mu \ell \chi \rho \iota \tau \sigma \hat{v} \hat{a} \xi \rho \nu \sigma s)$; and so the condition laid down by Archimedes is that the axis of the segment of the paraboloid of revolution shall not be greater than three-quarters of the latus rectum or principal parameter of the generating parabola.

οὖν παράλληλος ὰ ἐφαπτομένα ἁ ΚΩ τᾶς τοῦ κώνου τομᾶς κατὰ τὸ Π, καὶ ἀπὸ τοῦ Π παρὰ τὰν

ΝΟ ἄχθω ὰ ΠΦ· τέμνει δὴ ὰ ΠΦ δίχα τὰν ΙΣ· δέδεικται γὰρ ἐν τοῖς κωνικοῖς. τετμάσθω ά ΠΦ, ωστε είμεν διπλασίαν τὰν ΠΒ τᾶς ΒΦ, καὶ ά ΝΟ κατὰ τὸ Ρ τετμάσθω, ὅστε καὶ τὰν ΟΡ τᾶς ΡΝ διπλασίαν είμεν ἐσσεῖται δὴ τοῦ μείζονος ἀποτμάματος τοῦ στερεοῦ κέντρον τοῦ βάρεος τὸ Ρ, τοῦ δὲ κατὰ τὰν ΙΠΟΣ τὸ Β. δέδεικται γὰρ έν ταις Ισορροπίαις, ὅτι παντός ὀρθογωνίου κωνοειδέος τμάματος το κέντρον τοῦ βάρεος έστιν έπὶ τοῦ ἄξονος διηρημένου οὕτως, ὥστε τὸ ποτὶ τὰ κορυφὰ τοῦ ἄξονος τμὰμα διπλάσιον εἶμεν τοῦ λοιποῦ. ἀφαιρεθέντος δη τοῦ κατὰ τὰν ΙΠΟΣ τμάματος στερεοῦ ἀπὸ τοῦ ὅλου τοῦ λοιποῦ κέντρον έσσείται τοῦ βάρεος ἐπὶ τᾶς ΒΓ εὐθείας δέδεικται γὰρ τοῦτο ἐν τοῖς Στοιχείοις τῶν μηχανικῶν, ὅτι, εἴ κα μέγεθος ἀφαιρεθῆ μὴ τὸ αὐτὸ κέντρον ἔχον τοῦ βάρεος τῶ ὅλω μεγέθει, τοῦ λοιποῦ τὸ κέντρον έσσείται του βάρεος έπι τας εὐθείας τας έπιζευγνυούσας τὰ κέντρα τοῦ τε ὅλου μεγέθεος καὶ τοῦ 254

with IS. Therefore let $K\Omega$ be drawn parallel [to IS] and touching the section of the cone at II, and from Π let $\Pi\Phi$ be drawn parallel to NO; then $\Pi\Phi$ bisects IS—for this is proved in the [Elements of] Conics.^a Let $\Pi\Phi$ be cut so that $\Pi B = 2B\Phi$, and let NO be cut at P so that OP = 2PN; then P will be the centre of gravity of the greater segment of the solid, and B that of IIIO Σ ; for it is proved in the books On Equilibriums that the centre of gravity of any segment of a right-angled conoid is at the point dividing the axis in such a manner that the segment towards the vertex of the axis is double of the remainder.^b Now if the solid segment I∏O∑ be taken away from the whole, the centre of gravity of the remainder will lie upon the straight line $B\Gamma$; for it has been proved in the Elements of Mechanics that if any magnitude be taken away not having the same centre of gravity as the whole magnitude, the centre of gravity of the remainder will be on the straight line joining the centres [of gravity] of the whole magnitude and of the part

^a Presumably in the works of Aristaeus or Euclid, but it is also Quad. Parab. 1.

b The proof is not in any extant work by Archimedes.

άφηρημένου εκβεβλημένας επὶ τὰ αὐτά, εφ' ἃ τὸ κέντρον τοῦ ὅλου μεγέθεός ἐστιν. ἐκβεβλήσθω δη ά ΒΡ ἐπὶ τὸ Γ, καὶ ἔστω τὸ Γ τὸ κέντρον τοῦ βάρεος τοῦ λοιποῦ μεγέθεος. ἐπεὶ οὖν ἁ ΝΟ τῶς μὲν ΟΡ ἡμιολία, τᾶς δὲ μέχρι τοῦ ἄξονος οὐ μείζων ἢ ἡμιολία, δῆλον, ὅτι ἁ ΡΟ τᾶς μέχρι τοῦ ἄξονος οὖκ ἐστὶ μείζων ἡ ΠΡ ἄρα ποτὶ τὰν ΚΩ γωνίας άνίσους ποιεί, και ά ύπο των ΡΠΩ γίνεται δξεία. ά ἀπὸ τοῦ Ρ ἄρα κάθετος ἐπὶ τὰν ΠΩ ἀγομένα μεταξύ πεσείται τῶν Π, Ω. πιπτέτω ὡς ά ΡΘ. ά ΡΘ ἄρα ὀρθά ἐστιν ποτὶ τὸ ‹ἀποτετμακὸς›¹ έπίπεδον, εν ώ εστιν ά ΣΙ, ο εστιν επί τας επιφανείας τοῦ ὑγροῦ. ἄχθωσαν δή τινες ἀπὸ τῶν Β, Γ παρὰ τὰν ΡΘ· ἐνεχθήσεται δὴ τὸ μὲν ἐκτὸς τοῦ ύγροῦ τοῦ μεγέθεος εἰς τὸ κάτω κατὰ τὰν διὰ τοῦ Γ ἀγομέναν κάθετον ὑπόκειται γὰρ ἕκαστον τῶν βαρέων εἰς τὸ κάτω φέρεσθαι κατὰ τὰν κάθετον τὰν διὰ τοῦ κέντρου ἀγομέναν τὸ δὲ ἐν τῷ ὑγρῷ μέγεθος, ἐπεὶ κουφότερον γίνεται τοῦ ύγροῦ, ἐνεχθήσεται εἰς τὸ ἄνω κατὰ τὰν κάθετον τὰν διὰ τοῦ Β ἀνομέναν. ἐπεὶ δὲ οὐ κατὰ τὰν αὐτὰν κάθετον ἀλλάλοις ἀντιθλίβονται, οὐ μενεῖ τὸ σχημα, άλλὰ τὰ μὲν κατὰ τὸ Α εἰς τὸ ἄνω ἐνεχθήσεται, τὰ δὲ κατὰ τὸ Λ εἰς τὸ κάτω, καὶ τοῦτο ἀεὶ έσσεῖται, εως αν ορθον αποκατασταθη.

¹ ἀποτετμακὸς, cf. supra, p. 252 line 8; Heiberg prints κ . . . os.

 $[^]a$ If the normal at II meets the axis in M, then OM is greater than "the line drawn as far as the axis "except in the case where II coincides with the vertex, which case is excluded by the conditions of this proposition. Hence OM is always greater than OP; and because the angle ΩIIM is right, the angle ΩIIP must be acute.

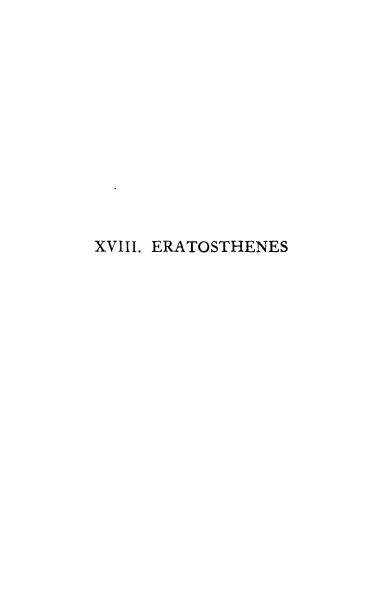

taken away, produced from the extremity which is the centre of gravity of the whole magnitude [De Plan. Aeguil. i. 8]. Let BP then be produced to Γ , and let Γ be the centre of gravity of the remaining magnitude. Then, since $NO = \frac{3}{2} \cdot OP$, and NO >4. (the line drawn as far as the axis), it is clear that PO>(the line drawn as far as the axis); therefore ΠP makes unequal angles with $K\Omega$, and the angle $P\Pi\Omega$ is acute a; therefore the perpendicular drawn from P to $\Pi\Omega$ will fall between Π , Ω . Let it fall as Pθ: then Pθ is perpendicular to the cutting plane containing \(\Sigma \)I, which is on the surface of the fluid. Now let lines be drawn from B, Γ parallel to P θ ; then the portion of the magnitude outside the fluid will be subject to a downward force along the line drawn through Γ-for it is postulated that each weight is subject to a downward force along the perpendicular drawn through its centre of gravity b; and since the magnitude in the fluid is lighter than the fluid.c it will be subject to an upward force along the perpendicular drawn through B.d But, since they are not subject to contrary forces along the same perpendicular, the figure will not remain at rest but the portion on the side of A will move upwards and the portion on the side of A will move downwards, and this will go on continually until it is restored to the upright position.

^b Cf. supra, p. 245: possibly a similar assumption to this effect has fallen out of the text.

^c A tacit assumption, which limits the generality of the opening statement of the proposition that the segment may have any weight relative to the fluid.

^d v. supra, p. 251.

^a Several of Eratosthenes' achievements have already been described—his solution of the Delian problem (vol. i. pp. 290-297), and his sieve for finding successive odd numbers (vol. i. pp. 100-103). Archimedes, as we have seen, dedicated the Method to him, and the Cattle Problem, as we have also seen, is said to have been sent through him to the Alexandrian mathematicians. It is generally supposed that Ptolemy credits him with having calculated the distance between the tropics (or twice the obliquity of the ecliptic) at 11,83rds. of a complete circle or 47° 29′ 39″, but Ptolemy's meaning is not clear. Eratosthenes also calculated the distances of the sun and moon from the earth and the size of the sun. Fragments of an astronomical poem which he wrote under the title 260

XVIII. ERATOSTHENES 4

(a) GENERAL

Suidas, s.r. Eratosthenes

ERATOSTHENES, son of Aglaus, others say of Ambrosius; a Cyrencan, a pupil of the philosopher Ariston of Chios, of the grammarian Lysanias of Cyrene and of the poet Callimachus b; he was sent for from Athens by the third Ptolemy and stayed till the fifth. Owing to taking second place in all branches of learning, though approaching the highest excellence, he was called Beta. Others called him a Second or New Plato, and yet others Pentathlon. He was born in the 126th Olympiad and died at the age

Hermes have survived. He was the first person to attempt a scientific chronology from the siege of Troy in two separate works, and he wrote a geographical work in three books. His writings are critically discussed in Bernhardy's Eratosthenica (Berlin, 1822).

^b Callimachus, the famous poet and grammarian, was also a Cyrenean. He opened a school in the suburbs of Alexandria and was appointed by Ptolemy Philadelphus chief librarian of the Alexandrian library, a post which he held till his death c. 240 B.C. Fratosthenes later held the same post.

^c Euergetes I (reigned 246-221 B.c.), who sent for him to be tutor to his son and successor Philopator (r. vol. i. pp. 256, 296).

^a Epiphanes (reigned 204-181 B.c.). • 276-273 B.c.

πιάδι καὶ ἐτελεύτησεν π̄ ἐτῶν γεγονώς, ἀποσχόμενος τροφῆς διὰ τὸ ἀμβλυώττειν, μαθητὴν ἐπίσημον καταλιπὼν 'Αριστοφάνην τὸν Βυζάντιονοῦ πάλιν 'Αρίσταρχος μαθητής. μαθηταὶ δὲ αὐτοῦ Μνασέας καὶ Μένανδρος καὶ "Αριστις. ἔγραψε δὲ φιλόσοφα καὶ ποιήματα καὶ ἱστορίας, 'Αστρονομίαν ῆ Καταστερισμούς,' Περὶ τῶν κατὰ φιλοσοφίαν αἰρέσεων, Περὶ ἀλυπίας, διαλόγους πολλοὺς καὶ γραμματικὰ συχνά.

1 Καταστερισμούς coni. Portus, Καταστηρίγμους codd.

^c This work is extant, but is not thought to be genuine in 262

^a Not, of course, Aristarchus of Samos, the mathematicían, but the celebrated Samothracian grammarian.

b Mnaseas was the author of a work entitled Περίπλους, whose three sections dealt with Europe, Asia and Africa, and a collection of oracles given at Delphi.

ERATOSTHENES

of eighty of voluntary starvation, having lost his sight; he left a distinguished pupil, Aristophanes of Byzantium; of whom in turn Aristarchus a was a pupil. Among his pupils were Mnaseas, Menander and Aristis. He wrote philosophical works, poems and histories, Astronomy or Placings Among the Stars, On Philosophical Divisions, On Freedom from Pain, many dialogues and numerous grammatical works.

(b) On Means

Pappus, Collection vii. 3, ed. Hultsch 636. 18-25

The order of the aforesaid books in the *Treasury of Analysis* is as follows...the two books of Eratosthenes *On Means.*^a

Pappus, Collection vii. 21, ed. Hultsch 660. 18-662. 18

Loci in general are termed fixed, as when Apollonius at the beginning of his own Elements says the locus of a point is a point, the locus of a line is a line, the locus of a surface is a surface and the locus of a solid is a solid; or progressive, as when it is said that the locus of a point is a line, the locus of a line is a surface and the locus of a surface is a solid; or circumambient as

its extant form; it contains a mythology and description of the constellations under forty-four heads. The general title ' $A\sigma\tau\rho\rho\nu\rho\mu(\alpha)$ may be a mistake for ' $A\sigma\tau\rho\rho\nu\theta\epsilon\sigma(\alpha)$; elsewhere

it is alluded to under the title Κατάλογοι.

^d The inclusion of this work in the *Treasury of Analysis*, along with such works as those of Euclid, Aristaeus and Apollonius, shows that it was a standard treatise. It is not otherwise mentioned, but the *loci with reference to means* referred to in the passage from Pappus next cited were presumably discussed in it.

οί δὲ ἀναστροφικοί, ὡς σημείου μὲν ἐπιφάνειαν, γραμμῆς δὲ στερεόν. [. . . οἱ δὲ ὑπὸ Ἐρατοσθένους ἐπιγραφέντες τόποι πρὸς μεσότητας ἐκ τῶν προειρημένων εἰσὶν τῷ γένει, ἀπὸ δὲ τῆς ἰδιότητος τῶν ὑποθέσεων . . . ἐκείνοις.]¹

(c) The "Platonicus"

Theon Smyr., ed. Hiller 81, 17-82, 5

Έρατοσθένης δὲ ἐν τῷ Πλατωνικῷ φησι, μὴ ταὐτὸν εἶναι διάστημα καὶ λόγον. ἐπειδὴ λόγος μέν ἐστι δύο μεγεθῶν ἡ πρὸς ἄλληλα ποιὰ σχέσις, γίνεται δ' αὕτη καὶ ἐν διαφόροις (καὶ ἐν ἀδιαφόροις).² οἶον ἐν ῷ λόγῳ ἐστὶ τὸ αἰσθητὸν πρὸς τὸ νοητόν, ἐν τούτῳ δόξα πρὸς ἐπιστήμην, καὶ διαφέρει καὶ τὸ νοητὸν τοῦ ἐπιστητοῦ ῷ καὶ ἡ δόξα τοῦ αἰσθητοῦ. διάστημα δὲ ἐν διαφέρουσι μόνον, ἢ κατὰ τὸ μέγεθος ἢ κατὰ ποιότητα ἢ κατὰ θέσιν ἢ ἄλλως ὁπωσοῦν. δῆλον δὲ καὶ ἐντεῦθεν,

¹ The passage of which this forms the concluding sentence is attributed by Hultsch to an interpolator. To fill the lacuna before ἐκείνοις he suggests ἀνόμοιοι ἐκείνοις, following Halley's rendering, "diversa sunt ab illis."

² καὶ ἐν ἀδιαφόροις add. Hiller.

$$2y = x + z$$
, $y^2 = xz$, $y(x + z) = 2xz$, $x(x - y) = z(y - z)$, $x(x - y) = y(y - z)$;

these represent respectively the arithmetic, geometric and harmonic means, and the means subcontrary to the harmonic and geometric means (v. vol. i. pp. 122-125). Zeuthen has 264

^a Tannery conjectured that these were the loci of points such that their distances from three fixed lines provided a "médiété," *i.e.*, loci (straight lines and conics) which can be represented in trilinear co-ordinates by such equations as

ERATOSTHENES

when it is said that the locus of a point is a surface and the locus of a line is a solid. [... the loci described by Eratosthenes as having reference to means belong to one of the aforesaid classes, but from a peculiarity in the assumptions are unlike them.]^a

(c) The "Platonicus"

Theon of Smyrna, ed. Hiller 81. 17-82. 5

Eratosthenes in the Platonicus b says that interval and ratio are not the same. Inasmuch as a ratio is a sort of relationship of two magnitudes one towards the other. there exists a ratio both between terms that are different and also between terms that are not different. For example, the ratio of the perceptible to the intelligible is the same as the ratio of opinion to knowledge, and the difference between the intelligible and the known is the same as the difference of opinion from the perceptible. But there can be an interval only between terms that are different, according to magnitude or quality or position or in some other way. It is thence clear that ratio is

an alternative conjecture on similar lines (Die Lehre von den

Kegelschnitten im Altertum, pp. 320-321).

b Theon cites this work in one other passage (ed. Hiller 2. 3-12) telling how Plato was consulted about the doubling of the cube; it has already been cited (vol. i. p. 256). Eratosthenes, own solution of the problem has already been given in vol. i. pp. 290-297, and a letter purporting to be from Eratosthenes to Ptolemy Euergetes is given in vol. i. pp. 256-261. Whether the *Platonicus* was a commentary on Plato or a dialogue in which Plato was an interlocutor cannot be decided.

^c Cf. Eucl. v. Def. 3, cited in vol. i. p. 414.

A reference to Plato, Rep. vi. 509 D—511 E, vii. 517 A—518 B.

ὅτι λόγος διαστήματος ἔτερον· τὸ γὰρ ἤμισυ πρὸς τὸ διπλάσιον ⟨καὶ τὸ διπλάσιον πρὸς τὸ ἤμισυ⟩¹ λόγον μὲν οὐ τὸν αὐτὸν ἔχει, διάστημα δὲ τὸ αὐτό.

(d) Measurement of the Earth

Cleom. De motu circ. i. 10. 52, ed. Ziegler 94. 23-100. 23

Καὶ ἡ μὲν τοῦ Ποσειδωνίου ἔφοδος περὶ τοῦ κατά την γην μεγέθους τοιαύτη, ή δε τοῦ Ἐρατοσθένους γεωμετρικής εφόδου έχομένη, καὶ δοκοῦσά τι ἀσαφέστερον ἔχειν. ποιήσει δὲ σαφῆ τὰ λεγόμενα ὑπ' αὐτοῦ τάδε προϋποτιθεμένων ήμων. ὑποκείσθω ήμιν πρώτον μεν κάνταῦθα, ύπὸ τῷ αὐτῷ μεσημβρινῷ κεῖσθαι Συήνην καὶ 'Αλεξάνδρειαν, καὶ δεύτερον, τὸ διάστημα τὸ μεταξύ των πόλεων πεντακισχιλίων σταδίων είναι, . καὶ τρίτον, τὰς καταπεμπομένας ἀκτîνας ἀπὸ διαφόρων μερών τοῦ ήλίου ἐπὶ διάφορα τῆς γῆς μέρη παραλλήλους είναι ουτως γάρ έχειν αὐτάς οί γεωμέτραι υποτίθενται. τέταρτον έκεινο υποκείσθω, δεικνύμενον παρά τοῖς γεωμέτραις, τὰς είς παραλλήλους έμπιπτούσας εὐθείας τὰς ἐναλλάξ γωνίας ἴσας ποιεῖν, πέμπτον, τὰς ἐπὶ ἴσων γωνιῶν βεβηκυίας περιφερείας όμοίας είναι, τουτέστι την αὐτὴν ἀναλογίαν καὶ τὸν αὐτὸν λόγον ἔχειν πρὸς τους οικείους κύκλους, δεικνυμένου και τούτου παρὰ τοῖς γεωμέτραις. ὁπόταν γὰρ περιφέρειαι έπὶ ἴσων γωνιῶν ὧσι βεβηκυῖαι, ἂν μία ἡτισοῦν

¹ καὶ . . . ἤμισυ add. Hiller.

^a The difference between ratio and interval is explained a little more neatly by Theon himself (ed. Hiller 81. 6-9): 266

ERATOSTHENES

different from interval; for the relationship of the half to the double and of the double to the half does not furnish the same ratio, but it does furnish the same interval.a

(d) Measurement of the Earth

Cleomedes, on the Circular Motion of the Heavenly Bodies i. 10, 52, ed. Ziegler 94, 23-100, 23

Such then is Posidonius's method of investigating the size of the earth, but Eratosthenes' method depends on a geometrical argument, and gives the impression of being more obscure. What he says will, however, become clear if the following assumptions are made. Let us suppose, in this case also, first that Svene and Alexandria lie under the same meridian circle: secondly, that the distance between the two cities is 5000 stades; and thirdly, that the rays sent down from different parts of the sun upon different parts of the earth are parallel; for the geometers proceed on this assumption. Fourthly, let us assume that, as is proved by the geometers, straight lines falling on parallel straight lines make the alternate angles equal, and fifthly, that the arcs subtended by equal angles are similar, that is, have the same proportion and the same ratio to their proper circles-this also being proved by the geometers. For whenever arcs of circles are subtended by equal angles, if any one of these is (say) one-tenth

διαφέρει δὲ διάστημα καὶ λόγος, ἐπειδὴ διάστημα μέν ἐστι τὸ μεταξύ τῶν ὁμογενῶν τε καὶ ἀνίσων ὅρων, λόγος δὲ ἀπλῶς ἡ των όμογενων όρων πρός άλλήλους σχέσις.

b Cleomedes probably wrote about the middle of the first century B.c. His handbook De motu circulari corporum caelestium is largely based on Posidonius.

αὐτῶν δέκατον ἢ μέρος τοῦ οἰκείου κύκλου, καὶ αἱ λοιπαὶ πᾶσαι δέκατα μέρη γενήσονται τῶν οἰκείων κύκλων.

Τούτων δ κατακρατήσας οὐκ ἂν χαλεπῶς τὴν «φοδον τοῦ Ἐρατοσθένους καταμάθοι ἔχουσαν ούτως. ύπο τῷ αὐτῷ κεῖσθαι μέσημβρινῷ φησι Συήνην καὶ 'Αλεξάνδρειαν. ἐπεὶ οὖν μέγιστοι τῶν εν τῷ κόσμω οἱ μεσημβρινοί, δεῖ καὶ τοὺς ὑποκειμένους τούτοις τῆς γῆς κύκλους μεγίστους είναι ἀναγκαίως. ὤστε ἡλίκον ἂν τὸν διὰ Συήνης καὶ 'Αλεξανδρείας ήκοντα κύκλον της γης ή έφοδος αποδείξει αυτη, τηλικούτος και δ μέγιστος έσται της γης κύκλος. φησὶ τοίνυν, καὶ έχει οὔτως, την Συήνην ύπὸ τῷ θερινῷ τροπικῷ κεῖσθαι κύκλῳ. ὁπόταν οὖν ἐν καρκίνῳ γενόμενος ὁ ἥλιος καὶ θερινάς ποιῶν τροπάς ἀκριβῶς μεσουρανήση, ἄσκιοι γίνονται οἱ τῶν ὡρολογίων γνώμονες ἀναγκαίως, κατὰ κάθετον ἀκριβῆ τοῦ ἡλίου ὑπερκειμένου καὶ τοῦτο γίνεσθαι λόγος ἐπὶ σταδίους τριακοσίους την διάμετρον. ἐν ᾿Αλεξανδρεία δὲ τῆ αὐτῆ ώρα ἀποβάλλουσιν οἱ τῶν ὡρολογίων γνώμονες σκιάν, ἄτε πρός ἄρκτφ μᾶλλον τῆς Συήνης ταύτης τῆς πόλεως κειμένης. ὑπὸ τῷ αὐτῷ μεσημβρινῷ τοίνυν καὶ μεγίστω κύκλω τῶν πόλεων κειμένων, αν περιαγάγωμεν περιφέρειαν από τοῦ ἄκρου τῆς τοῦ γνώμονος σκιᾶς ἐπὶ τὴν βάσιν αὐτὴν τοῦ γνώμονος τοῦ ἐν ᾿Αλεξανδρείᾳ ώρολογίου, αὕτη ή περιφέρεια τμημα γενήσεται τοῦ μεγίστου τῶν έν τῆ σκάφη κύκλων, ἐπεὶ μεγίστω κύκλω ὑπόκειται ή τοῦ ώρολογίου σκάφη. εἰ οὖν έξῆς νοήσαιμεν εὐθείας διὰ τῆς γῆς ἐκβαλλομένας ἀφ' έκατέρου τῶν γνωμόνων, πρὸς τῷ κέντρω τῆς γῆς 268

ERATOSTHENES

of its proper circle, all the remaining arcs will be tenth parts of their proper circles.

Anyone who has mastered these facts will have no difficulty in understanding the method of Eratosthenes, which is as follows. Svene and Alexandria, he asserts, are under the same meridian. Since meridian circles are great circles in the universe, the circles on the earth which lie under them are necessarily great circles also. Therefore, of whatever size this method shows the circle on the earth through Syene and Alexandria to be, this will be the size of the great circle on the earth. He then asserts, as is indeed the case, that Svene lies under the summer tropic. Therefore, whenever the sun, being in the Crab at the summer solstice, is exactly in the middle of the heavens, the pointers of the sundials necessarily throw no shadows, the sun being in the exact vertical line above them; and this is said to be true over a space 300 stades in diameter. But in Alexandria at the same hour the pointers of the sundials throw shadows, because this city lies farther to the north than Svene. As the two cities lie under the same meridian great circle, if we draw an arc from the extremity of the shadow of the pointer to the base of the pointer of the sundial in Alexandria, the arc will be a segment of a great circle in the bowl of the sundial, since the bowl lies under the great circle. If then we conceive straight lines produced in order from each of the pointers through the earth, they

συμπεσοθνται. ἐπεὶ οὖν τὸ ἐν Συήνη ώρολόγιον κατὰ κάθετον ὑπόκειται τῷ ἡλίω, αν ἐπινοήσωμεν εὐθεῖαν ἀπὸ τοῦ ἡλίου ἥκουσαν ἐπ' ἄκρον τὸν τοῦ ώρολογίου γνώμονα, μία γενήσεται εὐθεῖα ή ἀπὸ τοῦ ἡλίου μέχρι τοῦ κέντρου τῆς γῆς ἤκουσα. ἐὰν οὖν ἐτέραν εὐθεῖαν νοήσωμεν ἀπὸ τοῦ ἄκρου τῆς καιᾶς τοῦ γνώμονος δι' ἄκρου τοῦ γνώμονος ἐπὶ τὸν ἤλιον ἀναγομένην ἀπὸ τῆς ἐν Αλεξανδρεία σκάφης, αυτη καὶ ή προειρημένη εὐθεῖα παράλληλοι γενήσονται ἀπό διαφόρων γε τοῦ ἡλίου μερῶν λοι γενήσονται ἀπὸ διαφόρων γε τοῦ ὴλίου μερῶν ἐπὶ διάφορα μέρη τῆς γῆς διήκουσαι. εἰς ταύτας τοίνυν παραλλήλους οὕσας ἐμπίπτει εὐθεῖα ἡ ἀπὸ τοῦ κέντρου τῆς γῆς ἐπὶ τὸν ἐν ᾿Αλεξανδρεία γνώμονα ἥκουσα, ὥστε τὰς ἐναλλὰξ γωνίας ἴσας ποιεῖν ὧν ἡ μέν ἐστι πρὸς τῷ κέντρῳ τῆς γῆς κατὰ σύμπτωσιν τῶν εὐθειῶν, αἷ ἀπὸ τῶν ώρολογίων ἤχθησαν ἐπὶ τὸ κέντρον τῆς γῆς, γινομένη, ἡ δὲ κατὰ σύμπτωσιν ἄκρου τοῦ ἐν ᾿Αλεξανδρεία γνώμονος καὶ τῆς ἀπ᾽ ἄκρου τῆς σκιᾶς αὐτοῦ ἐπὶ τὸν ἥλιον διὰ τῆς πρὸς αὐτὸν ψαύσεως ἀναχθείσης γεγενημένη. καὶ ἐπὶ μὲν ταύτης βέβηκε περι- φέρεια ἡ ἀπ᾽ ἄκρου τῆς σκιᾶς τοῦ γνώμονος ἐπὶ φέρεια ή ἀπ' ἄκρου τῆς σκιᾶς τοῦ γνώμονος ἐπὶ τὴν βάσιν αὐτοῦ περιαχθεῖσα, ἐπὶ δὲ τῆς πρὸς τῷ κέντρῳ τῆς γῆς ἡ ἀπὸ Συήνης διήκουσα εἰς ᾿Αλεξάνδρειαν. ὅμοιαι τοίνυν αὶ περιφέρειαί εἰσιν άλλήλαις έπ' ἴσων γε γωνιῶν βεβηκυῖαι. δν ἄρα αλληλαις επ ισων γε γωνιων ρερηκυιαι. ον αρα λόγον έχει ή εν τῆ σκάφη πρὸς τὸν οἰκεῖον κύκλον, τοῦτον έχει τὸν λόγον καὶ ἡ ἀπὸ Συήνης εἰς ᾿Αλεξάνδρειαν ἥκουσα. ἡ δέ γε εν τῆ σκάφη πεντηκοστὸν μέρος εὐρίσκεται τοῦ οἰκείου κύκλου. δεῖ οὖν ἀναγκαίως καὶ τὸ ἀπὸ Συήνης εἰς ᾿Αλεξάνδρειαν διάστημα πεντηκοστὸν εἶναι μέρος τοῦ 270

ERATOSTHENES

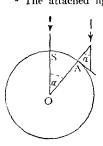

will meet at the centre of the earth. Now since the sundial at Syene is vertically under the sun, if we conceive a straight line drawn from the sun to the top of the pointer of the sundial, the line stretching from the sun to the centre of the earth will be one straight line. If now we conceive another straight line drawn upwards from the extremity of the shadow of the pointer of the sundial in Alexandria, through the top of the pointer to the sun, this straight line and the aforesaid straight line will be parallel, being straight lines drawn through from different parts of the sun to different parts of the earth. Now on these parallel straight lines there falls the straight line drawn from the centre of the earth to the pointer at Alexandria, so that it makes the alternate angles equal; one of these is formed at the centre of the earth by the intersection of the straight lines drawn from the sundials to the centre of the earth; the other is at the intersection of the top of the pointer in Alexandria and the straight line drawn from the extremity of its shadow to the sun through the point where it meets the pointer. Now this latter angle subtends the arc carried round from the extremity of the shadow of the pointer to its base, while the angle at the centre of the earth subtends the arc stretching from Syene to Alexandria. But the arcs are similar since they are subtended by equal angles. Whatever ratio, therefore, the arc in the bowl of the sundial has to its proper circle, the arc reaching from Syene to Alexandria has the same ratio. But the arc in the bowl is found to be the fiftieth part of its proper circle. Therefore the distance from Svene to Alexandria must necessarily be a fiftieth part of the great

μεγίστου της γης κύκλου καὶ έστι τοῦτο σταδίων πεντακισχιλίων. δ άρα σύμπας κύκλος γίνεται μυριάδων είκοσι πέντε. και ή μεν Έρατοσθένους ἔφοδος τοιαύτη.

Δέον δὲ ἔστω, εἰ τύχοι, τὴν μεταξὸ ᾿Αλεξανδρείας καὶ 'Ρώμης όδον ἐκμετρῆσαι τὴν ἐπ' εὐθείας, τήν γε έπὶ κύκλου περιφερείας μεγίστου τοῦ ἐν τῆ γῆ, προσομολογουμένου τοῦ ὅτι περίμετρος τῆς γῆς σταδίων έστι με και έτι Β, ως δ μάλιστα των άλλων ἀκριβέστερον πεπραγματευμένος 'Ερατοσθένης δείκνυσιν έν (τῶ) ἐπιγραφομένω Περὶ τῆς άναμετρήσεως της γης.

1 τῶ add. H. Schone.

⁴ The attached figure will help to elucidate Cleomedes. S is Syene and A Alexandria; the centre of the earth is O. The sun's rays at the two places are represented by the broken straight lines. If α be the angle made by the sun's rays with the pointer of the sundial at Alexandria (OA produced), the angle SOA is also equal to a, or one-fiftieth of four right angles. The arc SA is known to be 5000 stades and it follows that the whole circumference of the earth must be 250000 stades.

ERATOSTHENES

circle of the earth. And this distance is 5000 stades. Therefore the whole great circle is 250000 stades. Such is the method of Eratosthenes.

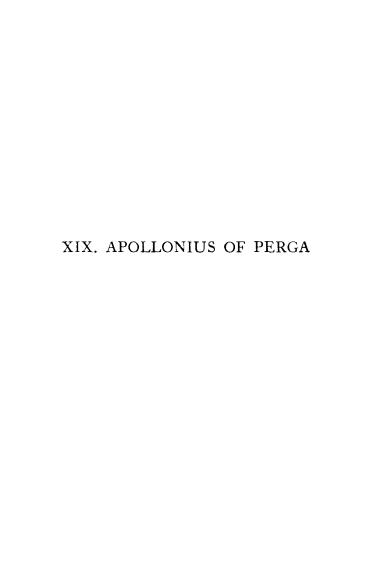

Heron, Dioptra 36, ed. H. Schone 302, 10-17

Let it be required, perchance, to measure the distance between Alexandria and Rome along the arc of a great circle,^b on the assumption that the perimeter of the earth is 252000 stades, as Eratosthenes, who investigated this question more accurately than others, shows in the book which he wrote On the Measurement of the Earth.^c

^b Lit. "along the circumference of the greatest circle on the earth."

^c Strabo (ii. 5. 7) and Theon of Smyrna (ed. Hiller 124. 10-12) also give Eratosthenes' measurement as 252000 stades against the 250000 of Cleomedes. "The reason of the discrepancy is not known; it is possible that Eratosthenes corrected 250000 to 252000 for some reason, perhaps in order to get a figure devisible by 60 and, incidentally, a round number (700) of stades for one degree. If Pliny (N.H. xii. 13. 53) is right in saying that Eratosthenes made 40 stades equal to the Egyptian σχοΐνος, then, taking the σχοΐνος at 12000 Royal cubits of 0.525 metres, we get 300 such cubits, or 157.5 metres, i.e., 516.73 feet, as the length of the stade. On this basis 252000 stades works out to 24662 miles, and the diameter of the earth to about 7850 miles, only 50 miles shorter than the true polar diameter, a surprisingly close approximation, however much it owes to happy accidents in the calculation" (Heath, H.G.M. ii. 107).

^a Scarcely anything more is known of the life of one of the greatest geometers of all time than is stated in this brief reference. From Pappus, Coll. vii., ed. Hultsch 67 (quoted in vol. i. p. 488), it is known that he spent much time at Alexandria with Euclid's successors. Ptolemy Euergetes reigned 246-221 B.c., and as Ptolemaeus Chennus (apud Photii Bibl., cod. cxc., ed. Bekker 151 b 18) mentions an astro-276

XIX. APOLLONIUS OF PERGA

- (a) THE CONIC SECTIONS
- (i.) Relation to Previous Works

Eutocius, Commentary on Apollonius's Conics, Apoll, Perg. ed. Heiberg ii. 168. 5-170, 26

Apollonius the geometer, my dear Anthemius, flourished at Perga in Pamphylia during the time of Ptolemy Euergetes, as is related in the life of Archimedes written by Heraclius, who also says that Archimedes first conceived the theorems in conics and that Apollonius, finding they had been discovered by Archimedes but not published, appropriated them for himself, but in my opinion he errs. For in many places Archimedes appears to refer to the elements of conics as an older work, and moreover Apollonius does not claim to be giving his own discoveries; otherwise he would not have described his purpose as "to investigate these properties more fully and more

nomer named Apollonius who flourished in the time of Ptolemy Philopator (221–204 B.C.), the great geometer is probably meant. This fits in with Apollonius's dedication of Books iv.-viii. of his Conics to King Attalus I (247–197 B.C.). From the preface to Book i., quoted infra (p. 281), we gather that Apollonius visited Eudemus at Pergamum, and to Eudemus he dedicated the first two books of the second edition of his work.

More probably Heraclides, c. supra, p. 18 n. a.

έξειργάσθαι ταῦτα παρὰ τὰ ὑπὸ τῶν ἄλλων γε-γραμμένα." ἀλλ' ὅπερ φησὶν ὁ Γέμινος ἀληθές ἐστιν, ὅτι οἱ παλαιοὶ κῶνον ὁριζόμενοι τὴν τοῦ όρθογωνίου τριγώνου περιφοράν μενούσης μιᾶς τῶν περὶ τὴν ὀρθὴν εἰκότως καὶ τοὺς κώνους πάντας ὀρθοὺς ὑπελάμβανον γίνεσθαι καὶ μίαν τομὴν ἐν ἐκάστῳ, ἐν μὲν τῷ ὀρθογωνίῳ τὴν νῦν καλουμένην παραβολήν, ἐν δὲ τῷ ἀμβλυγωνίῳ τὴν ύπερβολήν, εν δε τω όξυγωνίω την ελλειψιν και έστι παρ' αὐτοῖς εὐρεῖν οὕτως ὀνομαζομένας τὰς τομάς. ὧσπερ οὖν τῶν ἀρχαίων ἐπὶ ένὸς έκάστου εἴδους τριγώνου θεωρησάντων τὰς δύο ὀρθὰς πρότερον έν τῷ ἰσοπλεύρω καὶ πάλιν έν τῷ ἰσοσκελεί καὶ υστερον ἐν τῷ σκαληνῷ οἱ μεταγενέστεροι καθολικόν θεώρημα ἀπέδειξαν τοιοῦτο· παντὸς τριγώνου αἱ ἐντὸς τρεῖς γωνίαι δυσὶν ὀρθαῖς ἴσαι εἰσίν· οὕτως καὶ ἐπὶ τῶν τοῦ κώνου τομῶν· την μεν γάρ λεγομένην όρθογωνίου κώνου τομήν έν ὀρθογωνίφ μόνον κώνφ ἐθεώρουν τεμνομένφ ἐπιπέδφ ὀρθῷ πρὸς μίαν πλευρὰν τοῦ κώνου, τὴν δε τοῦ ἀμβλυγωνίου κώνου τομὴν ἐν ἀμβλυγωνίω γινομένην κώνω απεδείκνυσαν, την δέ τοῦ όξυγωνίου εν οξυγωνίω, όμοίως επί πάντων των κώνων άγοντες τὰ ἐπίπεδα ὀρθὰ πρὸς μίαν πλευρὰν τοῦ κώνου· δηλοῖ δὲ καὶ αὐτὰ τὰ ἀρχαῖα ὀνόματα τῶν γραμμῶν. ὕστερον δὲ ᾿Απολλώνιος ὁ Περγαίος καθόλου τι έθεώρησεν, ότι έν παντί κώνω καὶ ὀρθῷ καὶ σκαληνῷ πᾶσαι αἱ τομαί εἰσι κατὰ και οροφ και οκακηνώ πασαι αι τομαι εωτ κατα διάφορον τοῦ ἐπιπέδου πρὸς τὸν κῶνον προσβολήν· δν καὶ θαυμάσαντες οἱ κατ' αὐτὸν γενόμενοι διὰ τὸ θαυμάσιον τῶν ὑπ' αὐτοῦ δεδειγμένων κωνικῶν θεωρημάτων μέγαν γεωμέτρην εκάλουν. ταῦτα 278

generally than is done in the works of others." a what Geminus says is correct: defining a cone as the figure formed by the revolution of a right-angled triangle about one of the sides containing the right angle, the ancients naturally took all cones to be right with one section in each—in the right-angled cone the section now called the parabola, in the obtuse-angled the hyperbola, and in the acute-angled the ellipse; and in this may be found the reason for the names they gave to the sections. Just as the ancients. investigating each species of triangle separately, proved that there were two right angles first in the equilateral triangle, then in the isosceles, and finally in the scalene, whereas the more recent geometers have proved the general theorem, that in any triangle the three internal angles are equal to two right angles, so it has been with the sections of the cone; for the ancients investigated the so-called section of a rightangled cone in a right-angled cone only, cutting it by a plane perpendicular to one side of the cone, and they demonstrated the section of an obtuse-angled cone in an obtuse-angled cone and the section of an acute-angled cone in the acute-angled cone, in the cases of all the cones drawing the planes in the same way perpendicularly to one side of the cone; hence, it is clear, the ancient names of the curves. But later Apollonius of Perga proved generally that all the sections can be obtained in any cone, whether right or scalene, according to different relations of the plane to the In admiration for this, and on account of the remarkable nature of the theorems in conics proved by him, his contemporaries called him the "Great

² This comes from the preface to Book i., v. infra, p. 283.

'Απολλώνιος Εὐδήμφ χαίρειν.

Εὶ τῷ τε σώματι εὖ ἐπαιάγεις καὶ τὰ ἄλλα κατὰ γνώμην ἐστί σοι, καλῶς ἂν ἔχοι, μετρίως δὲ ἔχομεν καὶ αὐτοί. καθ' δν δὲ καιρὸν ήμην μετά σου ἐν Περγάμω, ἐθεώρουν σε σπεύδοντα μετασχεῖν τῶν πεπραγμένων ἡμῖν κωνικῶν· πέπομφα οὖν σοι τὸ πρῶτον βιβλίον διορθωσάμενος, τὰ δὲ λοιπά, ὅταν εὐαρεστήσωμεν, ἐξαποστελοῦμεν· οὐκ ἀμνημονεῖν γὰρ οἴομαί σε παρ' ἐμοῦ ἀκηκοότα, διότι τὴν περὶ ταῦτα ἔφοδον ἐποιησάμην ἀξιωθεὶς ὑπὸ Ναυκράτους τοῦ γεωμέτρου, καθ' δν καιρὸν ἐσχόλαζε

A passage already quoted (vol. i. pp. 486-489) from Pappus (ed. Hultsch 672, 18-678, 24) informs us that treatises on the conic sections were written by Aristaeus and Euclid. Aristaeus' work, in five books, was entitled Solid Loci; Euclid's

280

^a Menaechmus, as shown in vol. i. pp. 278-283, and more particularly p. 283 n. a, solved the problem of the doubling of the cube by means of the intersection of a parabola with a hyperbola, and also by means of the intersection of two parabolas. This is the earliest mention of the conic sections in Greek literature, and therefore Menaechmus (fl. 360-350 B.C.) is generally credited with their discovery; and as Fratosthenes' epigram (vol. i. p. 296) speaks of "cutting the cone in the triads of Menaechmus," he is given credit for discovering the ellipse as well. He may have obtained them all by the method suggested by Geminus, but Heath (H.G.M. ii. 111-116) gives cogent reasons for thinking that he may have obtained his rectangular hyperbola by a section of a right-angled cone parallel to the axis.

Geometer." Geminus relates these details in the sixth book of his *Theory of Mathematics.*

(ii.) Scope of the Work

Apollonius, Conics i., Preface, Apoll. Perg. ed. Heiberg i. 2. 2-4. 28

Apollonius to Eudemus ^b greeting.

If you are in good health and matters are in other respects as you wish, it is well; I am pretty well too. During the time I spent with you at Pergamum, I noticed how eager you were to make acquaintance with my work in conics; I have therefore sent to you the first book, which I have revised, and I will send the remaining books when I am satisfied with them. I suppose you have not forgotten hearing me say that I took up this study at the request of Naucrates the geometer, at the time when he came

Conics was in four books. The work of Aristaeus was obviously more original and more specialized; that of Euclid was admittedly a compilation largely based on Aristaeus. Euclid flourished about 300 B.C. As noted in vol. i. p. 495 n. a, the focus-directrix property must have been known to Euclid, and probably to Aristaeus; curiously, it does not appear in Apollonius's treatise.

Many properties of conics are assumed in the works of Archimedes without proof and several have been encountered in this work; they were no doubt taken from the works of Aristaeus or Euclid. As the reader will notice, Archimedes' terminology differs in several respects from that of Apollonius, apart from the fundamental difference on which Geminus

laid stress.

The history of the conic sections in antiquity is admirably treated by Zeuthen. Die Lehre von den Kegelschnitten im Altertum (1886) and Heath, Apollonius of Perga, xvii-clvi.

^b Not, of course, the pupil of Aristotle who wrote the famous *History of Geometry*, unhappily lost.

παρ' ήμιν παραγενηθείς είς 'Αλεξάνδρειαν, καὶ διότι πραγματεύσαντες αὐτὰ ἐν ὀκτὰ βιβλίοις ἐξ αὐτῆς μεταδεδώκαμεν αὐτὰ εἰς τὸ σπουδαιότερον διὰ τὸ πρὸς ἔκπλῳ αὐτὸν εἶναι οὐ διακαθάραντες, ἀλλὰ πάντα τὰ ὑποπίπτοντα ἡμιν θέντες ὡς ἔσχατον ἐπελευσόμενοι. ὅθεν καιρὸν νῦν λαβόντες ἀεὶ τὸ τυγχάνον διορθώσεως ἐκδίδομεν. καὶ ἐπεὶ συμβέβηκε καὶ ἄλλους τινὰς τῶν συμμεμιχότων ἡμιν μετειληφέναι τὸ πρῶτον καὶ τὸ δεύτερον βιβλίον πρὶν ἢ διορθωθῆναι, μὴ θαυμάσης, ἐὰν

⁶ A necessary observation, because Archimedes had used the terms in a different sense.

to Alexandria and stayed with me, and that, when I had completed the investigation in eight books, I gave them to him at once, a little too hastily, because he was on the point of sailing, and so I was not able to correct them, but put down everything as it occurred to me, intending to make a revision at the end. Accordingly, as opportunity permits, I now publish on each occasion as much of the work as I have been able to correct. As certain other persons whom I have met have happened to get hold of the first and second books before they were corrected, do not be surprised if you come across them in a different form.

Of the eight books the first four form an elementary introduction. The first includes the methods of producing the three sections and the opposite branches [of the hyperbola] and their fundamental properties, which are investigated more fully and more generally than in the works of others. The second book includes the properties of the diameters and the axes of the sections as well as the asymptotes, with other things generally and necessarily used in determining limits of possibility; and what I call diameters and axes you will learn from this book. The third book includes many remarkable theorems useful for the syntheses of solid loci and for determining limits of possibility; most of these theorems, and the most elegant, are new, and it was their discovery which made me realize that Euclid had not worked out the synthesis of the locus with respect to three and four lines, but only a chance portion of it, and that not successfully; for the synthesis could not be completed without the theorems discovered by me.b

b For this locus, and Pappus's comments on Apollonius's claims, v. vol. i. pp. 486-489.

σύνθεσιν. τὸ δὲ τέταρτον, ποσαχῶς αι τῶν κώνων τομαὶ ἀλλήλαις τε καὶ τῇ τοῦ κύκλου περιφερεία συμβάλλουσι, καὶ ἄλλα ἐκ περισσοῦ, ὧν οὐδέτερον ὑπὸ τῶν πρὸ ἡμῶν γέγραπται, κώνου τομὴ ἢ κύκλου περιφέρεια κατὰ πόσα σημεῖα συμβάλλουσι.

Τὰ δὲ λοιπά ἐστι περιουσιαστικώτερα· ἔστι γὰρ τὸ μὲν περὶ ἐλαχίστων καὶ μεγίστων ἐπὶ πλέον, τὸ δὲ περὶ ἴσων καὶ ὁμοίων κώνου τομῶν, τὸ δὲ περὶ διοριστικῶν θεωρημάτων, τὸ δὲ προβλημάτων κωνικῶν διωρισμένων. οὐ μὴν ἀλλὰ καὶ πάντων ἐκδοθέντων ἔξεστι τοῖς περιτυγχάνουσι κρίνειν αὐτά, ὡς ἂν αὐτῶν ἔκαστος αἱρῆται. εὐτύχει.

extends to infinity when the straight line which describes them is produced to infinity; I call the fixed point the *vertex*, and the straight line drawn through this point and the centre of the circle I call the *axis*.

The figure bounded by the circle and the conical surface between the vertex and the circumference of the circle I term a cone, and by the vertex of the cone I mean the point which is the vertex of the surface, and by the axis I mean the straight line drawn from the vertex to the centre of the circle, and by the base I mean the circle.

Of cones, I term those *right* which have their axes at right angles to their bases, and *scalene* those which have their axes not at right angles to their bases.

In any plane curve I mean by a diameter a straight line drawn from the curve which bisects all straight lines drawn in the curve parallel to a given straight line, and by the vertex of the curve I mean the extremity of the straight line on the curve, and I describe each of the parallels as being drawn ordinatenise to the diameter.

Similarly, in a pair of plane curves I mean by a transverse diameter a straight line which cuts the two curves and bisects all the straight lines drawn in either curve parallel to a given straight line, and by the vertices of the curves I mean the extremities of the diameter on the curves; and by an erect diameter I mean a straight line which lies between the two curves and bisects the portions cut off between the curves of all straight lines drawn parallel to a given

2

Έὰν κῶνος ἐπιπέδῳ τμηθῆ διὰ τοῦ ἄξονος, τμηθῆ δὲ καὶ ἐτέρῳ ἐπιπέδῳ τέμνοντι τὸ ἐπίπεδον, ἐν ῷ ἐστιν ἡ βάσις τοῦ κώνου, κατ' εὐθεῖαν πρὸς ὀρθὰς οὖσαν ἤτοι τῆ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου ἢ τῆ ἐπ' εὐθείας αὐτῆ, αἱ ἀγόμεναι εὐθεῖαι ἀπὸ τῆς γενηθείσης τομῆς ἐν τῆ τοῦ κώνου ἐπιφανεία, ἢν ἐποίησε τὸ τέμνον ἐπίπεδον, παράλληλοι τῆ πρὸς ὀρθὰς τῆ βάσει τοῦ τριγώνου εὐθεία ἐπὶ τὴν κοινὴν τομὴν πεσοῦνται τοῦ τέμ-

¹ δύο om. Heiberg.

This proposition defines a conic section in the most general way with reference to any diameter. It is only much 288

straight line; and I describe each of the parallels as drawn ordinate-wise to the diameter.

By conjugate diameters in a curve or pair of curves I mean straight lines of which each, being a diameter, bisects parallels to the other.

By an axis of a curve or pair of curves I mean a straight line which, being a diameter of the curve or pair of curves, bisects the parallels at right angles.

By conjugate axes in a curve or pair of curves I mean straight lines which, being conjugate diameters, bisect at right angles the parallels to each other.

(iv.) Construction of the Sections

Ibid., Props. 7-9, Apoll. Perg. ed. Heiberg i. 22. 26-36. 5

Prop. 7 a

If a cone be cut by a plane through the axis, and if it be also cut by another plane cutting the plane containing the base of the cone in a straight line perpendicular to the base of the axial triangle, or to the base produced, a section will be made on the surface of the cone by the cutting plane, and straight lines drawn in it parallel to the straight line perpendicular to the base of the axial triangle will meet the common section of the cutting plane and the axial

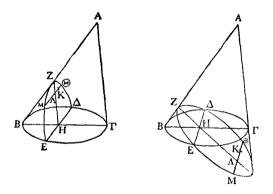

later in the work (i. 52-58) that the principal axes are introduced as diameters at right angles to their ordinates. The proposition is an excellent example of the generality of Apollonius's methods.

Apollonius followed rigorously the Euclidean form of proof. In consequence his general enunciations are extremely long and often can be made tolerable in an English rendering only by splitting them up; but, though Apollonius seems to have taken a malicious pleasure in their length, they are formed on a perfect logical pattern without a superfluous word.

Lit. " the triangle through the axis."

νοντος επιπέδου καὶ τοῦ διὰ τοῦ ἄξονος τρινώνου καὶ προσεκβαλλόμεναι έως τοῦ έτέρου μέρους τῆς τομῆς δίχα τμηθήσονται ὑπ' αὐτῆς, καὶ ἐὰν μὲν ὀρθὸς ἢ ὁ κῶνος, ἡ ἐν τῇ βάσει εὐθεῖα πρὸς ὀρθὰς ἔσται τῇ κοινἢ τομἢ τοῦ τέμνοντος ἐπιπέδου καὶ τοῦ διὰ τοῦ ἄξονος τριγώνου, ἐὰν δὲ σκαληνός, οὖκ αἰεὶ πρὸς ὀρθὰς ἔσται, ἀλλ' ὅταν τὸ διὰ τοῦ ἄξονος ἐπίπεδον πρὸς ὀρθὰς ἢ τῆ βάσει τοῦ κώνου. Εστω κώνος, οὖ κορυφὴ μὲν τὸ Α σημεῖον,

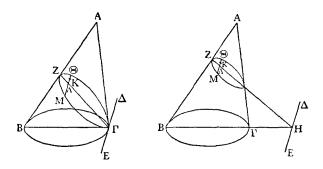

βάσις δὲ ὁ ΒΓ κύκλος, καὶ τετμήσθω ἐπιπέδω διὰ

τοῦ ἄξονος, καὶ ποιείτω τομὴν τὸ ΑΒΓ τρίνωνου. τετμήσθω δὲ καὶ ἐτέρω ἐπιπέδω τέμνοντι τὸ επίπεδον, εν ώ εστιν ο BΓ κύκλος, κατ' εὐθεῖαν την ΔΕ ήτοι πρός όρθας ούσαν τη ΒΓ η τη έπ' εὐθείας αὐτῆ, καὶ ποιείτω τομὴν ἐν τῆ ἐπιφανεία τοῦ κώνου τὴν ΔΖΕ· κοινὴ δὴ τομὴ τοῦ τέμνοντος έπιπέδου και τοῦ ΑΒΓ τριγώνου ή ΖΗ. και 290

triangle and, if produced to the other part of the section, will be bisected by it; if the cone be right, the straight line in the base will be perpendicular to the common section of the cutting plane and the axial triangle; but if it be scalene, it will not in general be perpendicular, but only when the plane through the axis is perpendicular to the base of the cone.

Let there be a cone whose vertex is the point A and whose base is the circle B\Gamma, and let it be cut by a

plane through the axis, and let the section so made be the triangle AB Γ . Now let it be cut by another plane cutting the plane containing the circle B Γ in a straight line ΔE which is either perpendicular to B Γ or to B Γ produced, and let the section made on the surface of the cone be ΔZE^a ; then the common section of the cutting plane and of the triangle AB Γ

^a This applies only to the first two of the figures given in the mss.

εἰλήφθω τι σημεῖον ἐπὶ τῆς $\Delta ZΕ$ τομῆς τὸ Θ , καὶ ἤχθω διὰ τοῦ Θ τῆ ΔE παράλληλος ή ΘK . λέγω, ὅτι ἡ ΘK συμβαλεῖ τῆ ZH καὶ ἐκβαλλομένη ἔως τοῦ ἐτέρου μέρους τῆς ΔZE τομῆς δίχα

τμηθήσεται ύπο της ΖΗ εύθείας.

'Έπεὶ γὰρ κῶνος, οὖ κορυφὴ μὲν τὸ Α σημεῖον, βάσις δὲ ὁ ΒΓ κύκλος, τέτμηται ἐπιπέδῳ διὰ τοῦ ἄξονος, καὶ ποιεῖ τομὴν τὸ ΑΒΓ τρίγωνον, εἴληπται δέ τι σημεῖον ἐπὶ τῆς ἐπιφανείας, ὁ μή ἐστιν ἐπὶ πλευρᾶς τοῦ ΑΒΓ τριγώνου, τὸ Θ, καί ἐστι κάθετος ἡ ΔΗ ἐπὶ τὴν ΒΓ, ἡ ἄρα διὰ τοῦ Θ τῆ ΔΗ παράλληλος ἀγομένη, τουτέστιν ἡ ΘΚ, συμβαλεῖ τῷ ΑΒΓ τριγώνω καὶ προσεκβαλλομένη ἔως τοῦ ἐτέρου μέρους τῆς ἐπιφανείας δίχα τμηθήσεται ὑπὸ τοῦ τριγώνου. ἐπεὶ οὖν ἡ διὰ τοῦ Θ τῆ ΔΕ παράλληλος ἀγομένη συμβάλλει τῷ ΑΒΓ τριγώνω καὶ ἐστιν ἐν τῷ διὰ τῆς ΔΖΕ τομῆς ἐπιπέδω, ἐπὶ τὴν κοινὴν ἄρα τομὴν πεσείται τοῦ τέμνοντος ἐπιπέδου καὶ τοῦ ΑΒΓ τριγώνου. κοινὴ δὲ τομή ἐστι τῶν ἐπιπέδων ἡ ΖΗ· ἡ ἄρα διὰ τοῦ Θ τῆ ΔΕ παράλληλος ἀγομένη πεσείται ἐπὶ τὴν ΖΗ· καὶ προσεκβαλλομένη ἔως τοῦ ἐτέρου μέρους τῆς ΔΖΕ τομῆς δίχα τμηθήσεται ὑπὸ τῆς ΖΗ εὐθείας.

"Ητοι δὴ ὁ κῶνος ὀρθός ἐστιν, ἢ τὸ διὰ τοῦ ἄξονος τρίγωνον τὸ ΑΒΓ ὀρθόν ἐστι πρὸς τὸν ΒΓ

κύκλον, η οὐδέτερον.

"Εστω πρότερον ὁ κῶνος ὀρθός: εἴη ἂν οὖν καὶ τὸ ΑΒΓ τρίγωνον ὀρθὸν πρὸς τὸν ΒΓ κύκλον. ἐπεὶ οὖν ἐπίπεδον τὸ ΑΒΓ πρὸς ἐπίπεδον τὸ ΒΓ ὀρθόν ἐστι, καὶ τῆ κοινῆ αὐτῶν τομῆ τῆ ΒΓ ἐν ἐνὶ τῶν ἐπιπέδων τῷ ΒΓ πρὸς ὀρθὰς ἦκται ἡ ΔΕ, 292

is ZH. Let any point Θ be taken on Δ ZE, and through Θ let Θ K be drawn parallel to Δ E. I say that Θ K intersects ZH and, if produced to the other part of the section Δ ZE, it will be bisected by the straight line ZH.

For since the cone, whose vertex is the point A and base the circle $B\Gamma$, is cut by a plane through the axis and the section so made is the triangle ABT, and there has been taken any point θ on the surface, not being on a side of the triangle AB Γ , and ΔH is perpendicular to BI, therefore the straight line drawn through Θ parallel to ΔH , that is ΘK , will meet the triangle $AB\Gamma$ and, if produced to the other part of the surface, will be bisected by the triangle [Prop. 6]. Therefore, since the straight line drawn through θ parallel to ΔE meets the triangle ABT and is in the plane containing the section ΔZE , it will fall upon the common section of the cutting plane and the triangle ABT. But the common section of those planes is ZH; therefore the straight line drawn through θ parallel to ΔE will meet ZH; and if it be produced to the other part of the section ΔZE it will be bisected by the straight line ZH.

Now the cone is right, or the axial triangle AB Γ is perpendicular to the circle B Γ , or neither.

First, let the cone be right; then the triangle ABF will be perpendicular to the circle BF [Def. 3; Eucl. xi. 18]. Then since the plane ABF is perpendicular to the plane BF, and ΔE is drawn in one of the planes perpendicular to their common section BF, therefore

ή ΔE ἄρα τῷ $AB\Gamma$ τριγώνῳ ἐστὶ πρὸς ὀρθάς· καὶ πρὸς πάσας ἄρα τὰς ἁπτομένας αὐτῆς εὐθείας καὶ οὔσας ἐν τῷ $AB\Gamma$ τριγώνῳ ὀρθή ἐστιν. ὥστε

καὶ πρὸς τὴν ΖΗ ἐστι πρὸς ὀρθάς.

Μη ἔστω δη ὁ κῶνος ὀρθός. εἰ μὲν οὖν τὸ διὰ τοῦ ἄξονος τρίγωνον ὀρθόν ἐστι πρὸς τὸν ΒΓ κύκλον, όμοίως δείξομεν, ότι καὶ ἡ ΔΕ τῆ ΖΗ έστι πρὸς ὀρθάς. μὴ ἔστω δὴ τὸ διὰ τοῦ ἄξονος τρίγωνον τὸ ΑΒΓ ὀρθὸν πρὸς τὸν ΒΓ κύκλον. $\lambda \dot{\epsilon} \gamma \omega$, ὅτι οὐδ $\dot{\epsilon}$ ή $\Delta \dot{E}$ τ $\hat{\eta}$ $\dot{Z}H$ $\dot{\epsilon} \sigma \tau \iota$ πρὸς ὀρθάς. εὶ γὰρ δυνατόν, ἔστω: ἔστι δὲ καὶ τῆ ΒΓ πρὸς ορθάς ή ἄρα ΔΕ έκατέρα τῶν ΒΓ, ΖΗ ἐστι πρὸς όρθάς. καὶ τῶ διὰ τῶν ΒΓ, ΖΗ ἐπιπέδω ἄρα πρὸς ὀρθάς ἐστι. τὸ δὲ διὰ τῶν ΒΓ, ΗΖ ἐπίπεδόν έστι τὸ ΑΒΓ καὶ ἡ ΔΕ ἄρα τῶ ΑΒΓ τριγώνω ἐστὶ πρὸς ὀρθάς. καὶ πάντα ἄρα τὰ δι' αὐτῆς ἐπίπεδα τῷ ΑΒΓ τριγώνω ἐστὶ πρὸς ὀρθάς. έν δέ τι τῶν διὰ τῆς ΔΕ ἐπιπέδων ἐστὶν ὁ ΒΓ κύκλος δ ΒΓ ἄρα κύκλος πρὸς ὀρθάς ἐστι τῶ ΑΒΓ τριγώνω. ὤστε καὶ τὸ ΑΒΓ τρίγωνον ὀρθὸν ἔσται πρὸς τὸν ΒΓ κύκλον· ὅπερ οὐχ ὑπόκειται. οὐκ ἄρα ἡ ΔΕ τῆ ΖΗ ἐστι πρὸς ὀρθάς.

Πόρισμα

Έκ δὴ τούτου φανερόν, ὅτι τῆς ΔΖΕ τομῆς διάμετρός ἐστιν ἡ ΖΗ, ἐπείπερ τὰς ἀγομένας παραλλήλους εὐθεία τινὶ τῷ ΔΕ δίχα τέμνει, καὶ ὅτι
δυνατόν ἐστιν ὑπὸ τῆς διαμέτρου τῆς ΖΗ παραλλήλους τινὰς δίχα τέμνεσθαι καὶ μὴ πρὸς ὀρθάς.

 η'

'Εὰν κῶιος ἐπιπέδω τμηθῆ διὰ τοῦ ἄξοιος, 294

 ΔE is perpendicular to the triangle ABF [Eucl. xi. Def. 4]; and therefore it is perpendicular to all the straight lines in the triangle ABF which meet it [Eucl. xi. Def. 3]. Therefore it is perpendicular to ZH.

Now let the cone be not right. Then, if the axial triangle is perpendicular to the circle B Γ , we may similarly show that ΔE is perpendicular to ZH. Now let the axial triangle ABT be not perpendicular to the circle B Γ . I say that neither is ΔE perpendicular to ZH. For if it is possible, let it be; now it is also perpendicular to $\hat{B}\Gamma$; therefore ΔE is perpendicular to both $B\Gamma$, ZH. And therefore it is perpendicular to the plane through BF, ZH [Eucl. xi. 4]. But the plane through $B\Gamma$, HZ is $AB\Gamma$; and therefore ΔE is perpendicular to the triangle ABΓ. Therefore all the planes through it are perpendicular to the triangle ABI [Eucl. xi. 18]. But one of the planes through ΔE is the circle $B\Gamma$; therefore the circle $B\Gamma$ is perpendicular to the triangle ABF. Therefore the triangle AB Γ is perpendicular to the circle B Γ ; which is contrary to hypothesis. Therefore ΔE is not perpendicular to ZH.

Corollary

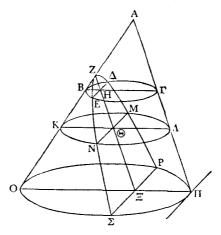

From this it is clear that ZH is a diameter of the section Δ ZE [Def. 4], inasmuch as it bisects the straight lines drawn parallel to the given straight line Δ E, and also that parallels can be bisected by the diameter ZH without being perpendicular to it.

Prop. 8

If a cone be cut by a plane through the axis, and it be
295

τμηθη δὲ καὶ ἐτέρω ἐπιπέδω τέμνοντι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν πρὸς ὀρθὰς οὖσαν τῃ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου, ἡ δὲ διάμετρος τῆς γινομένης ἐν τῃ ἐπιφανεία τομῆς ἤτοι παρὰ μίαν ἡ τῶν τοῦ τριγώνου πλευρῶν ἢ συμπίπτη αὐτῃ ἐκτὸς τῆς κορυφῆς τοῦ κώνου, προσεκβάλληται δὲ ἤ τε τοῦ κώνου ἐπιφάνεια καὶ τὸ τέμνον ἐπίπεδον εἰς ἄπειρον, καὶ ἡ τομὴ εἰς ἄπειρον αὐξηθήσεται, καὶ ἀπὸ τῆς διαμέτρου τῆς τομῆς πρὸς τῆς κορυφῆ πάση τῆ δοθείση εὐθεία ἴσην ἀπολήψεταί τις εὐθεῖα ἀγομένη ἀπὸ τῆς τοῦ κώνου τομῆς παρὰ τὴν ἐν τῆ βάσει τοῦ κώνου εὐθεῖαν.

Καὶ φανερόν, ὅτι πάση τῆ δοθείση εὐθεία ἴσην

AB Γ ; now let it be cut by another plane cutting the circle BI' in the straight line ΔE perpendicular to B Γ , and let the section made on the surface be the curve ΔZE ; let ZH, the diameter of the section ΔZE , be either parallel to AI' or let it, when produced, meet AI' beyond the point A. I say that if the surface of the cone and the cutting plane be produced to infinity, the section ΔZE will also increase to infinity.

For let the surface of the cone and the cutting plane be produced; it is clear that the straight lines, AB, AF, ZH are simultaneously produced. Since ZH is either parallel to $A\Gamma$ or meets it, when produced, beyond the point A, therefore ZH, AT when produced in the directions H. I', will never meet. Let them be produced accordingly, and let there be taken any point θ at random upon ZH, and through the point θ let $K\Theta\Lambda$ be drawn parallel to BI, and let $M\Theta N$ be drawn parallel to ΔE : the plane through KA, MN is therefore parallel to the plane through B Γ , ΔE [Eucl. xi. 15]. Therefore the plane KAMN is a circle [Prop. 4]. And since the points Δ , E, M, N are in the cutting plane, and are also on the surface of the cone, they are therefore upon the common section; therefore ∆ZE has increased to M, N. Therefore, when the surface of the cone and the cutting plane increase up to the circle KAMN, the section ΔZE increases up to the points M, N. Similarly we may prove that, if the surface of the cone and the cutting plane be produced to infinity, the section MAZEN will increase to infinity.

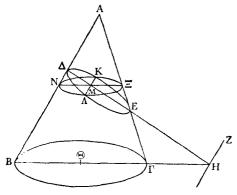

And it is clear that there can be cut off from the

ἀπολήψεταί τις ἀπὸ τῆς ΖΘ εὐθείας πρὸς τῷ Ζ σημείῳ. ἐὰν γὰρ τῆ δοθείση ἴσην θῶμεν τὴν ΖΞ καὶ διὰ τοῦ Ξ τῆ ΔΕ παράλληλον ἀγάγωμεν, συμπεσεῖται τῆ τομῆ, ὤσπερ καὶ ἡ διὰ τοῦ Θ ἀπεδείχθη συμπίπτουσα τῆ τομῆ κατὰ τὰ Μ, Ν σημεῖα· ὤστε ἄγεταί τις εὐθεῖα συμπίπτουσα τῆ τομῆ παράλληλος οὖσα τῆ ΔΕ ἀπολαμβάνουσα ἀπὸ τῆς ΖΗ εὐθεῖαν ἴσην τῆ δοθείση πρὸς τῷ Ζ σημείῳ.

 θ'

Έὰν κῶνος ἐπιπέδῳ τμηθῆ συμπίπτοντι μὲν ἐκατέρᾳ πλευρᾳ τοῦ διὰ τοῦ ἄξονος τριγώνου, μήτε δὲ παρὰ τὴν βάσιν ἠγμένῳ μήτε ὑπεναντίως, ἡ τομὴ οὐκ ἔσται κύκλος.

*Εστω κώνος, οδ κορυφή μέν το Α σημείον,

βάσις δὲ ὁ ΒΓ κύκλος, καὶ τετμήσθω ἐπιπέδῳ τινὶ μήτε παραλλήλῳ ὄντι τῆ βάσει μήτε ὑπ-

straight line $Z\Theta$ in the direction of the point Z an intercept equal to any given straight line. For if we place $Z\Xi$ equal to the given straight line and through Ξ draw a parallel to ΔE , it will meet the section, just as the parallel through Θ was shown to meet the section at the points M, N; therefore a straight line parallel to ΔE has been drawn to meet the section so as to cut off from ZH in the direction of the point Z an intercept equal to the given straight line.

Prop. 9

If a cone be cut by a plane meeting either side of the axial triangle, but neither parallel to the base nor sub-contrary, a the section will not be a circle.

Let there be a cone whose vertex is the point A and base the circle $B\Gamma$, and let it be cut by a plane neither parallel to the base nor subcontrary, and let

a In the figure of this theorem, the section of the cone by the plane ΔE would be a subcontrary section ($i\pi\epsilon var\tau(a \tau o\mu \eta)$) if the triangle ADE were similar to the triangle ABF, but in a contrary sense, i.e., if angle ADE = angle AFB. Apollonius proves in i. 5 that subcontrary sections of the cone are circles; it was proved in i. 4 that all sections parallel to the base are circles.

εναντίως, καὶ ποιείτω τομὴν ἐν τῆ ἐπιφανεία τὴν ΔΚΕ γραμμήν. λέγω, ὅτι ἡ ΔΚΕ γραμμἡ οὐκ ἔσται κύκλος.

Εὶ γὰρ δυνατόν, ἔστω, καὶ συμπιπτέτω τὸ τέμνον ἐπίπεδον τῆ βάσει, καὶ ἔστω τῶν ἐπιπέδων κοινή τομή ή ΖΗ, το δέ κέντρον τοῦ ΒΓ κύκλου **ἔστω** τὸ Θ΄, καὶ ἀπ' αὐτοῦ κάθετος ἤχθω ἐπὶ τὴν ZH ή ΘΗ, καὶ ἐκβεβλήσθω διὰ τῆς ἩΘ καὶ τοῦ ἄξονος ἐπίπεδον καὶ ποιείτω τομὰς ἐν τῆ κωνικῆ έπιφανεία τὰς ΒΑ, ΑΓ εὐθείας. ἐπεὶ οὖν τὰ Δ΄, Ε, Η σημεία έν τε τω διά της ΔΚΕ επιπέδω ἐστίν, ἔστι δὲ καὶ ἐν τῷ διὰ τῶν Α, Β, Γ, τὰ ἄρα Δ, Ε, Η σημεία έπὶ τῆς κοινῆς τομῆς τῶν ἐπιπέδων ἐστίν· εὐθεία ἄρα ἐστίν ἡ ΗΕΔ. εἰλήφθω δή τι ἐπὶ τῆς ΔΚΕ γραμμῆς σημεῖον τὸ Κ, καὶ διὰ τοῦ Κ τῆ ΖΗ παράλληλος ἤχθω ἡ ΚΛ· ἔσται δὴ ἴση ἡ ΚΜ τῆ ΜΛ. ἡ ἄρα ΔΕ διά-μετρός ἐστι τοῦ ΔΚΛΕ κύκλου. ἤχθω δὴ διὰ τοῦ Μ τῆ ΒΓ παράλληλος ἡ ΝΜΞ· ἔστι δὲ καὶ ή ΚΛ τῆ ΖΗ παράλληλος ωστε τὸ διὰ τῶν ΝΞ, ΚΜ επίπεδον παράλληλόν εστι τῶ διὰ τῶν ΒΓ, ΖΗ, τουτέστι τῆ βάσει, καὶ ἔσται ἡ τομὴ κύκ-λος. ἔστω ὁ ΝΚΞ. καὶ ἐπεὶ ἡ ΖΗ τῆ ΒΗ πρὸς ορθάς έστι, καὶ ή ΚΜ τῆ ΝΞ πρὸς ὀρθάς ἐστιν· ωστε τὸ ὑπὸ τῶν ΝΜΞ ἴσον ἐστὶ τῶ ἀπὸ τῆς ΚΜ. ἔστι δὲ τὸ ὑπὸ τῶν ΔME ἴσον τῷ ἀπὸ τῆς KM· κύκλος γὰρ ὑπόκειται ἡ $\Delta KE\Lambda$ γραμμή, καὶ διάμετρος αὐτοῦ ἡ ΔΕ. τὸ ἄρα ὑπὸ τῶν ΝΜΕ ἴσον ἐστὶ τῶ ὑπὸ ΔΜΕ. ἔστιν ἄρα ὡς ἡ ΜΝ πρὸς ΜΔ, οὖτως ἡ ΕΜ πρὸς ΜΞ. ὅμοιον ἄρα έστὶ τὸ ΔΜΝ τρίγωνον τῷ ΞΜΕ τριγώνω, καὶ ἡ ύπὸ ΔΝΜ γωνία ἴση ἐστὶ τῆ ὑπὸ ΜΕΞ΄. ἀλλὰ 302

the section so made on the surface be the curve $\Delta KE.$ I say that the curve ΔKE will not be a circle.

For, if possible, let it be, and let the cutting plane meet the base, and let the common section of the planes be ZH, and let the centre of the circle Bl' be Θ . and from it let θH be drawn perpendicular to ZH, and let the plane through HO and the axis be produced, and let the sections made on the conical surface be the straight lines BA, A Γ . Then since the points Δ , E, H are in the plane through Δ KE, and are also in the plane through A, B, Γ , therefore the points Δ , E, H are on the common section of the planes; therefore HEA is a straight line [Eucl. xi. 3]. Now let there be taken any point K on the curve ΔKE , and through K let KA be drawn parallel to ZH; then KM will be equal to $M\Lambda$ [Prop. 7]. Therefore ΔE is a diameter of the circle ΔKEA [Prop. 7, coroll.]. Now let NMΞ be drawn through M parallel to BΓ; but KΛ is parallel to ZH; therefore the plane through NΞ, KM is parallel to the plane through BΓ, ZH [Eucl. xi. 15], that is to the base, and the section will be a circle [Prop. 4]. Let it be NKE. And since ZH is perpendicular to BH, KM is also perpendicular to NE [Eucl. xi. 10]; therefore NM . $ME = KM^2$. ΔM . $ME = KM^2$; for the curve ΔKEA is by hypothesis a circle, and ΔE is a diameter in it. Therefore NM . $M\Xi = \Delta M$. ME. Therefore MN : $M\Delta = EM$: $M\Xi$. Therefore the triangle ΔMN is similar to the triangle ΞME , and the angle ΔNM is equal to the angle $ME\Xi$.

ή ὑπὸ ΔNM γωνία τῆ ὑπὸ $AB\Gamma$ ἐστιν ἴση παράλληλος γὰρ ἡ $N\Xi$ τῆ $B\Gamma$ · καὶ ἡ ὑπὸ $AB\Gamma$ ἄρα ἴση ἐστὶ τῆ ὑπὸ $ME\Xi$. ὑπεναντία ἄρα ἐστὶν ἡ τομή· ὅπερ οὐχ ὑπόκειται. οὐκ ἄρα κύκλος ἐστὶν ἡ ΔKE γραμμή.

ιa'

Έὰν κῶνος ἐπιπέδῳ τμηθῆ διὰ τοῦ ἄξονος, τμηθῆ δὲ καὶ ἑτέρῳ ἐπιπέδῳ τέμνοντι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν πρὸς ὀρθὰς οὖσαν τῆ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου, ἔτι δὲ ἡ διάμετρος τῆς τομῆς παράλληλος ἢ μιᾶ πλευρᾶ τοῦ διὰ τοῦ ἄξονος τριγώνου, ἤτις ᾶν ἀπὸ τῆς τομῆς τοῦ κώνου παράλληλος ἀχθῆ τῆ κοινῆ τομῆ τοῦ τέμνοντος ἐπιπέδου καὶ τῆς βάσεως τοῦ κώνου μέχρι τῆς διαμέτρου τῆς τομῆς, δυνήσεται τὸ περιεχόμενον ὑπό τε τῆς ἀπολαμβανομένης ὑπ' αὐτῆς ἀπὸ τῆς διαμέτρου πρὸς τῆ κορυφῆ τῆς τομῆς καὶ ἄλλης τινὸς εὐθείας, ἡ λόγον ἔχει πρὸς τὴν μεταξὺ τῆς τοῦ κώνου γωνίας καὶ τῆς κορυφῆς τῆς τομῆς, δυ τὸ τετράγωνον τὸ ἀπὸ τῆς βάσεως τοῦ διὰ τοῦ ἄξονος τριγώνου πρὸς τὸ περιεχόμενον ὑπὸ τῶν λοιπῶν τοῦ τριγώνου δύο πλευρῶν καλείσθω δὲ ἡ τοιαύτη τομὴ παραβολή.

"Εστω κώνος, οὖ τὸ Α΄ σημεῖον κορυφή, βάσις δὲ ὁ ΒΓ κύκλος, καὶ τετμήσθω ἐπιπέδω διὰ τοῦ ἄξονος, καὶ ποιείτω τομὴν τὸ ΑΒΓ τρίγωνον, τετμήσθω δὲ καὶ ἐτέρω ἐπιπέδω τέμνοντι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν τὴν ΔΕ πρὸς ὀρθὰς

304

But the angle ΔNM is equal to the angle $AB\Gamma$; for $N\Xi$ is parallel to $B\Gamma$; and therefore the angle $AB\Gamma$ is equal to the angle $ME\Xi$. Therefore the section is subcontrary [Prop. 5]; which is contrary to hypothesis. Therefore the curve ΔKE is not a circle.

(v.) Fundamental Properties

Ibid., Props. 11-14, Apoll. Perg. ed. Heiberg i. 36. 26-58. 7

Prop. 11

Let a cone be cut by a plane through the axis, and let it be also cut by another plane cutting the base of the cone in a straight line perpendicular to the base of the axial triangle, and further let the diameter of the section be parallel to one side of the axial triangle; then if any straight line be drawn from the section of the cone parallel to the common section of the cutting plane and the base of the cone as far as the diameter of the section, its square will be equal to the rectangle bounded by the intercept made by it on the diameter in the direction of the vertex of the section and a certain other straight line; this straight line will bear the same ratio to the intercept between the angle of the cone and the vertex of the segment as the square on the base of the axial triangle bears to the rectangle bounded by the remaining two sides of the triangle; and let such a section be called a parabola.

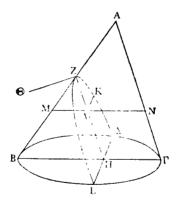

For let there be a cone whose vertex is the point A and whose base is the circle BI, and let it be cut by a plane through the axis, and let the section so made be the triangle ABI, and let it be cut by another plane cutting the base of the cone in the straight line

οὖσαν τῆ ΒΓ, καὶ ποιείτω τομὴν ἐν τῆ ἐπιφανεία τοῦ κώνου τὴν ΔΖΕ, ἡ δὲ διάμετρος τῆς τομῆς ἡ ΖΗ παράλληλος ἔστω μιὰ πλευρὰ τοῦ διὰ τοῦ ἄξονος τριγώνου τῆ ΑΓ, καὶ ἀπὸ τοῦ Ζ σημείου τῆ ΖΗ εὐθεία πρὸς ὀρθὰς ἤχθω ἡ ΖΘ, καὶ πεποιήσθω, ὡς τὸ ἀπὸ ΒΓ πρὸς τὸ ὑπὸ ΒΑΓ, οὕτως ἡ ΖΘ πρὸς ΖΑ, καὶ εἰλήφθω τι σημεῖον ἐπὶ τῆς τομῆς τυχὸι τὸ Κ, καὶ διὰ τοῦ Κ τῆ ΔΕ παράλληλος ἡ ΚΛ. λέγω, ὅτι τὸ ἀπὸ τῆς ΚΛ ἴσον ἐστὶ τῷ ὑπὸ τῶν ΘΖΛ.

"Ηχθω γὰρ διὰ τοῦ Λ τῆ ΒΓ παράλληλος ἡ ΜΝ· ἔστι δὲ καὶ ἡ ΚΛ τῆ ΔΕ παράλληλος· τὸ ἀρα διὰ τῶν ΚΛ, ΜΝ ἐπίπεδον παράλληλόν ἐστι τῷ διὰ τῶν ΒΓ, ΔΕ ἐπιπέδω, τουτέστι τῆ βάσει τοῦ κώνου. τὸ ἄρα διὰ τῶν ΚΛ, ΜΝ ἐπίπεδον κύκλος ἐστίν, οῦ διάμετρος ἡ ΜΝ. καὶ ἔστι κάθετος ἐπὶ τὴν ΜΝ ἡ ΚΛ, ἐπεὶ καὶ ἡ ΔΕ ἐπὶ τὴν ΒΓ· τὸ ἄρα ὑπὸ τῶν ΜΛΝ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΚΛ. καὶ ἐπεί ἐοτιν, ὡς τὸ ἀπὸ τῆς ΒΓ πρὸς τὸ ὑπὸ τῶν ΒΑΓ, οῦτως ἡ ΘΖ πρὸς ΖΑ, τὸ δὲ

 ΔE perpendicular to BI', and let the section so made on the surface of the cone be ΔZE , and let ZH, the diameter of the section, be parallel to AI', one side of the axial triangle, and from the point Z let $Z\Theta$ be drawn perpendicular to ZH, and let BI' : BA . AI' = $Z\Theta$: ZA, and let any point K be taken at random on the section, and through K let KA be drawn parallel to ΔE . I say that $KA^2 = \Theta Z$. ZA.

For let MN be drawn through Λ parallel to BI; but $K\Lambda$ is parallel to ΔE ; therefore the plane through

KA, MN is parallel to the plane through BF, ΔE [Eucl. xi. 15], that is to the base of the cone. Therefore the plane through KA, MN is a circle, whose diameter is MN [Prop. 4]. And KA is perpendicular to MN, since ΔE is perpendicular to BF [Eucl. xi. 10]; therefore $\Delta E = \Delta E = \Delta E$

And since $BI^2:BA:A\Gamma=\theta Z:ZA$,

ἀπὸ τῆς ΒΓ πρὸς τὸ ὑπὸ τῶν ΒΑΓ λόγον ἔχει τὸν συγκείμενον ἔκ τε τοῦ, ὃν ἔχει ἡ ΒΓ πρὸς ΓΑ καὶ ἡ ΒΓ πρὸς ΒΑ, ὁ ἄρα τῆς ΘΖ πρὸς ΖΑ λόγος σύγκειται ἐκ τοῦ τῆς ΒΓ πρὸς ΓΑ καὶ τοῦ τῆς ΒΓ πρὸς ΓΑ καὶ τοῦ τῆς ΒΓ πρὸς ΓΑ, οὕτως ἡ ΜΝ πρὸς ΝΑ, τουτέστιν ἡ ΜΛ πρὸς ΛΖ, ὡς δὲ ἡ ΒΓ πρὸς ΒΑ, οὕτως ἡ ΜΝ πρὸς ΜΑ, τουτέστιν ἡ ΛΜ πρὸς ΜΑ, τουτέστιν ἡ ΛΜ πρὸς ΜΑ, καὶ λοιπὴ ἡ ΝΛ πρὸς ΖΑ. ὁ ἄρα τῆς ΘΖ πρὸς ΖΑ λόγος σύγκειται ἐκ τοῦ τῆς ΜΛ πρὸς ΛΖ καὶ τοῦ τῆς ΝΛ πρὸς ΛΖ. ὁ δὲ συγκείμενος λόγος ἐκ τοῦ τῆς ΜΛ πρὸς ΛΖ καὶ τοῦ ὑπὸ ΜΛΝ ἐστι πρὸς τὸ ὑπὸ ΛΖΑ. ὡς ἄρα ἡ ΘΖ πρὸς ΖΑ, οὕτως τὸ ὑπὸ ΜΛΝ πρὸς τὸ ὑπὸ ΛΖΑ. ὡς ἄρα τὸ ὑπὸ ΜΛΝ πρὸς τὸ ὑπὸ ΛΖΑ, οὕτως τὸ ὑπὸ ΜΛΝ πρὸς τὸ ὑπὸ ΛΖΑ, οῦτως τὸ ὑπὸ ΜΛΝ τρὸς τὸ ὑπὸ ΛΖΑ, οῦτως τὸ ὑπὸ ΜΛΝ τρὸς τὸ ὑπὸ ΛΖΑ, οῦτως τὸ ὑπὸ ΘΖΛ πρὸς τὸ ὑπὸ ΜΛΝ ἴσον ἐστὶ τὸ ὑπὸ τῆς ΚΛ· καὶ τὸ ἀπὸ τῆς ΚΛ ἄρα ἴσον ἐστὶ τῶ ὑπὸ τῶν ΘΖΛ.

Καλείσθω δε ή μεν τοιαύτη τομή παραβολή, ή δε ΘΖ παρ' ην δύνανται αι καταγόμεναι τεταγμένως επι την ΖΗ διάμετρον, καλείσθω δε και δρθία.

ιβ΄

'Εὰν κῶνος ἐπιπέδῳ τμηθῆ διὰ τοῦ ἄξονος, τμηθῆ δὲ καὶ ἐτέρῳ ἐπιπέδῳ τέμνοντι τὴν βάσιν

^a A parabola (παραβολή) because the square on the ordinate $K\Lambda$ is applied (παραβαλεῦν) to the parameter ΘZ in the form 308

while $B\Gamma^2 : BA : A\Gamma = (B\Gamma : \Gamma A)(B\Gamma : BA),$

therefore $\Theta Z : ZA = (B\Gamma : \Gamma A)(\Gamma B : BA).$

But $B\Gamma : \Gamma A = MN : NA$

 $= M\Lambda : \Lambda Z$, [Eucl. vi. 4

and $B\Gamma : BA = MN : MA$

 $=\Lambda M: MZ$ [ibid.

 $=N\Lambda:ZA.$ [Eucl. vi. 2

Therefore $\Theta Z : ZA = (M\Lambda : \Lambda Z)(N\Lambda : ZA).$

But $(M\Lambda : \Lambda Z)(\Lambda N : Z\Lambda) = M\Lambda . \Lambda N : \Lambda Z . ZA$.

Therefore $\Theta Z : ZA = M\Lambda \cdot \Lambda N : \Lambda Z \cdot ZA$.

But $\Theta Z : ZA = \Theta Z . Z\Lambda : \Lambda Z . ZA$,

by taking a common height $Z\Lambda$;

therefore $M\Lambda \cdot \Lambda N : \Lambda Z \cdot ZA = \Theta Z \cdot Z\Lambda : \Lambda Z \cdot ZA$.

Therefore $M\Lambda \cdot \Lambda N = \Theta Z \cdot Z\Lambda$. [Eucl. v. 9

But $M\Lambda \cdot \Lambda N = K\Lambda^2$;

and therefore $K\Lambda^2 = \Theta Z \cdot Z\Lambda$.

Let such a section be called a parabola, and let ΘZ be called the parameter of the ordinates to the diameter ZH, and let it also be called the erect side (latus rectum).^a

Prop. 12

Let a cone be cut by a plane through the axis, and let it be cut by another plane cutting the base of the cone in

of the rectangle ΘZ . $Z\Lambda$, and is exactly equal to this rectangle. It was Apollonius's most distinctive achievement to have based his treatment of the conic sections on the Pythagorean theory of the application of areas $(\pi a \rho a \beta o \lambda \dot{\eta} \tau \hat{\omega} \nu \chi \omega \rho (\omega \nu)$, for which v. vol. i. pp. 186-215. The explanation of the term latus rectum will become more obvious in the cases of the hyperbola and the ellipse; v. infra, p. 317 n. a.

τοῦ κώνου κατ' εὐθεῖαν πρὸς ὀρθὰς οὖσαν τῆ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου, καὶ ἡ διάμετρος τῆς τομῆς ἐκβαλλομένη συμπίπτη μιὰ πλευρὰ τοῦ διὰ τοῦ ἄξονος τριγώνου ἐκτὸς τῆς τοῦ κώνου κορυφης, ήτις αν ἀπὸ της τομης ἀχθη παράλληλος τῆ κοινῆ τομῆ τοῦ τέμνοντος ἐπιπέδου καὶ τῆς βάσεως τοῦ κώνου, ἕως τῆς διαμέτρου τῆς τομῆς δυνήσεταί τι χωρίον παρακείμενον παρά τινα εὐθεῖαν, πρὸς ην λόγον ἔχει ή ἐπ' εὐθείας μὲν οὖσα τη διαμέτρω της τομης, υποτείνουσα δε την εκτός τοῦ τριγώνου γωνίαν, δυ τὸ τετράγωνου τὸ ἀπὸ τῆς ἦγμένης ἀπὸ τῆς κορυφῆς τοῦ κώνου παρὰ τὴν διάμετρον τῆς τομῆς ἔως τῆς βάσεως τοῦ τριγώνου πρός τὸ περιεχόμενον ὑπὸ τῶν τῆς βάσεως τμημάτων, ὧν ποιεῖ ἡ ἀχθεῖσα, πλάτος ἔχον τὴν ἀπολαμβανομένην ὑπ' αὐτῆς ἀπὸ τῆς διαμέτρου προς τη κορυφή της τομης, ύπερβάλλον είδει δμοίω τε καὶ δμοίως κειμένω τῷ περιεχομένω ὑπό τε τῆς ὑποτεινούσης τὴν ἐκτὸς γωνίαν τοῦ τριγώνου καὶ τῆς παρ' ἣν δύνανται αἱ καταγόμεναι καλείσθω δὲ ἡ τοιαύτη τομὴ ὑπερβολή.

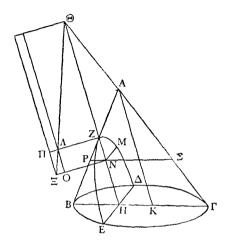

"Εστω κώνος, οὖ κορυφὴ μὲν τὸ Α σημεῖον, βάσις δὲ ὁ ΒΓ κύκλος, καὶ τετμήσθω ἐπιπέδω διὰ τοῦ ἄξονος, καὶ ποιείτω τομὴν τὸ ΑΒΓ τρίγωνον, τετμήσθω δὲ καὶ ἐτέρω ἐπιπέδω τέμνοντι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν τὴν ΔΕ πρὸς ὀρθὰς οὖσαν τῷ ΒΓ βάσει τοῦ ΑΒΓ τριγώνου, καὶ ποιείτω τομὴν ἐν τῷ ἐπιφανεία τοῦ κώνου τὴν ΔΖΕ γραμμήν, ἡ δὲ διάμετρος τῆς τομῆς ἡ ΖΗ ἐκβαλλομένη συμπιπτέτω μιᾶ πλευρᾶ τοῦ ΑΒΓ τριγώνου τῷ ΑΓ ἐκτὸς τῆς τοῦ κώνου κορυφῆς κατὰ τὸ Θ, καὶ διὰ τοῦ Α τῷ διαμέτρω τῆς τομῆς

312

diameter of the section, and let it cut B Γ , and from Z let Z Λ be drawn perpendicular to ZH, and let K Λ^2 : BK . K $\Gamma = Z\Theta$: Z Λ , and let there be taken at random any point M on the section, and through M let MN be drawn parallel to ΔE , and through N let NO Ξ be drawn parallel to Z Λ , and let $\Theta \Lambda$ be joined and produced to Ξ , and through Λ , Ξ , let ΛO , $\Xi \Pi$ be drawn parallel to ZN. I say that the square on MN is equal to Z Ξ , which is applied to the straight line Z Λ , having ZN for its breadth, and exceeding by the figure $\Lambda \Xi$ which is similar to the rectangle contained by ΘZ , Z Λ .

For let PN Σ be drawn through N parallel to B Γ ; but NM is parallel to ΔE ; therefore the plane through

άρα διὰ τῶν ΜΝ, ΡΣ ἐπίπεδον παράλληλόν ἐστι τῶ διὰ τῶν ΒΓ, ΔΕ, τουτέστι τῆ βάσει τοῦ κώνου. έὰν ἄρα ἐκβληθῆ τὸ διὰ τῶν ΜΝ, ΡΣ ἐπίπεδον, ή τομή κύκλος έσται, οδ διάμετρος ή ΡΝΣ. καὶ έστιν ἐπ' αὐτὴν κάθετος ἡ ΜΝ τὸ ἄρα ὑπὸ τῶν ΡΝΣ ἴσον ἐστὶ τῷ ἀπὸ τῆς ΜΝ. καὶ ἐπεί ἐστιν, ώς τὸ ἀπὸ ΑΚ πρὸς τὸ ὑπὸ ΒΚΓ, οὕτως ἡ ΖΘ πρὸς ΖΛ, ὁ δὲ τοῦ ἀπὸ τῆς ΑΚ πρὸς τὸ ὑπὸ ΒΚΓ λόγος σύγκειται έκ τε τοῦ, δν έχει ή ΑΚ πρὸς ΚΓ καὶ ἡ ΑΚ πρὸς ΚΒ, καὶ ὁ τῆς ΖΘ ἄρα πρὸς τὴν ΖΛ λόγος σύγκειται έκ τοῦ, δν ἔχει ἡ ΑΚ πρὸς ΚΓ καὶ ἡ ΑΚ πρὸς ΚΒ. ἀλλ' ὡς μὲν ἡ ΑΚ πρὸς ΚΓ, οὕτως ἡ ΘΗ πρὸς ΗΓ, τουτέστιν ἡ ΘΝ πρὸς ΝΣ, ώς δὲ ἡ ΑΚ πρὸς ΚΒ, οὕτως ἡ ΖΗ πρὸς ΗΒ, τουτέστιν ή ΖΝ πρὸς ΝΡ. ὁ ἄρα τῆς ΘΖ πρὸς ΖΛ λόγος σύγκειται έκ τε τοῦ τῆς ΘΝ πρὸς ΝΣ καὶ τοῦ τῆς ΖΝ πρὸς ΝΡ. ὁ δὲ συγκείμενος λόγος ἐκ τοῦ τῆς ΘΝ πρὸς ΝΣ καὶ τοῦ τῆς ΖΝ πρός ΝΡ ὁ τοῦ ὑπὸ τῶν ΘΝΖ ἐστι πρὸς τὸ ὑπὸ τῶν ΣΝΡ· καὶ ὡς ἄρα τὸ ὑπὸ τῶν ΘΝΖ πρὸς τὸ ύπὸ τῶν ΣΝΡ, οὕτως ἡ ΘΖ πρὸς ΖΛ, τουτέστιν $\dot{\eta}$ ΘN $\pi \rho \dot{\phi}_S$ $N\Xi$. $\dot{a}\lambda\lambda$, $\dot{\omega}_S$ $\dot{\eta}$ ΘN $\pi \rho \dot{\phi}_S$ $N\Xi$, $\tau \hat{\eta}_S$ ΖΝ κοινοῦ ὕψους λαμβανομένης οὕτως τὸ ὑπὸ τῶν ΘΝΖ πρὸς τὸ ὑπὸ τῶν ΖΝΞ, καὶ ὡς ἄρα τὸ ὑπὸ τῶν ΘΝΖ πρὸς τὸ ὑπὸ τῶν ΣΝΡ, οὕτως τὸ ὑπὸ τῶν ΘΝΖ πρὸς τὸ ὑπὸ τῶν ΞΝΖ. τὸ ἄρα ὑπὸ ΣΝΡ ἴσον ἐστὶ τῶ ὑπὸ ΕΝΖ. τὸ δὲ ἀπὸ ΜΝ ἴσον ἐδείχθη τῷ ὑπὸ ΣΝΡ· καὶ τὸ ἀπὸ της ΜΝ ἄρα ἴσον ἐστὶ τῷ ὑπὸ τῶν ΞΝΖ. τὸ δὲ ύπὸ ΞΝΖ ἐστι τὸ ΞΖ παραλληλόγραμμον. ἡ ἄρα

MN, P Σ is parallel to the plane through B Γ , ΔE [Eucl. xi. 15], that is to the base of the cone. If, then, the plane through MN, P Σ be produced, the section will be a circle with diameter PN Σ [Prop. 4]. And MN is perpendicular to it; therefore

PN .
$$N\Sigma = MN^2$$
.

And since $AK^2 : BK \cdot K\Gamma = Z\Theta : Z\Lambda$.

while $AK^2 : BK . K\Gamma = (AK : K\Gamma)(AK : KB)$,

therefore $Z(t): Z\Lambda = (AK : K\Gamma)(AK : KB)$.

But $AK : K\Gamma = \Theta H : H\Gamma$,

i.e., $= \Theta N : N\Sigma$, [Eucl. vi. 4

and AK : KB = ZH : HB,

i.e., = ZN : NP. [ibid.

Therefore $\Theta Z : Z\Lambda = (\Theta N : N\Sigma)(ZN : NP).$

But $(\Theta N : N\Sigma)(ZN : NP) = \Theta N . NZ : \Sigma N . NP$; and therefore

 $\Theta \mathbf{N} \cdot \mathbf{NZ} : \Sigma \mathbf{N} \cdot \mathbf{NP} = \Theta \mathbf{Z} : \mathbf{Z} \mathbf{\Lambda}$

 $=\Theta N: N\Xi.$ [ibid.

But $\Theta N : N\Xi = \Theta N . NZ : ZN . N\Xi$,

by taking a common height ZN.

And therefore

 $\Theta N \cdot NZ : \Sigma N \cdot NP = \Theta N \cdot NZ : \Xi N \cdot NZ$.

Therefore $\Sigma N \cdot NP = \Xi N \cdot NZ$. [Eucl. v. 9

But $MN^2 = \Sigma N \cdot NP$,

as was proved;

and therefore $MN^2 = \Xi N \cdot NZ$.

But the rectangle ΞN . NZ is the parallelogram ΞZ .

ΜΝ δύναται τὸ ΞΖ, δ παράκειται παρά τὴν ΖΛ. πλάτος έχον τὴν ZN, ὑπερβάλλον τῷ $\Lambda \Xi$ ὁμοί ω ὄντι τ $\hat{\omega}$ ὑπὸ τ $\hat{\omega}$ ν ΘΖ Λ . καλείσθ ω δὲ ἡ μὲν τοιαύτη τομη ύπερβολή, η δε ΛΖ παρ' ην δύνανται αί ἐπὶ τὴν ΖΗ καταγόμεναι τεταγμένως καλείσθω δὲ ή αὐτὴ καὶ ὀρθία, πλαγία δὲ ἡ ΖΘ.

Έαν κώνος ἐπιπέδω τμηθή διά τοῦ ἄξονος, τμηθη δε καὶ ετέρω επιπέδω συμπίπτοντι μεν εκατέρα πλευρά τοῦ διὰ τοῦ ἄξονος τριγώνου, μήτε δε παρὰ τὴν βάσιν τοῦ κώνου ἠγμένω μήτε ὑπεναντίως, τὸ δε ἐπίπεδον, ἐν ῷ ἐστιν ἡ βάσις τοῦ κώνου, καὶ τὸ τέμνον ἐπίπεδον συμπίπτη κατ' εὐθεῖαν πρὸς ὀρθὰς οὖσαν ἤτοι τῆ βάσει τοῦ διὰ τοῦ ἄξονος τριγώνου ἢ τῆ ἐπ' εὐθείας αὐτῆ, ἥτις ἄν ἀπὸ τῆς τομῆς τοῦ κώνου παράλληλος ἀχθῆ τῆ κοινή τομή των έπιπέδων έως τής διαμέτρου τής τομῆς, δυνήσεται τι χωρίον παρακείμενον παρά τινα εὐθεῖαν, πρὸς ἣν λόγον ἔχει ἡ διάμετρος τῆς τομῆς, ον τὸ τετράγωνον τὸ ἀπὸ τῆς ἡγμένης άπὸ τῆς κορυφῆς τοῦ κώνου παρὰ τὴν διάμετρον της τομης έως της βάσεως του τριγώνου πρός το περιεχόμενον ύπο των απολαμβανομένων ύπ' αὐτῆς πρὸς ταῖς τοῦ τριγώνου εὐθείαις, πλάτος ἔχον τὴν ἀπολαμβανομένην ὑπ' αὐτῆς ἀπὸ τῆς διαμέτρου πρὸς τῆ κορυφῆ τῆς τομῆς, ἐλλεῖπον είδει δμοίω τε και δμοίως κειμένω τῶ περιεχομένω ύπό τε της διαμέτρου και της παρ' ην δύνανται· καλείσθω δὲ ἡ τοιαύτη τομὴ ἔλλειψις. "Έστω κῶνος, οὖ κορυφὴ μὲν τὸ Α σημεῖον,

Therefore the square on MN is equal to ΞZ , which is applied to $Z\Lambda$, having ZN for its breadth, and exceeding by $\Lambda\Xi$ similar to the rectangle contained by ΘZ , $Z\Lambda$. Let such a section be called a hyperbola, let ΛZ be called the parameter to the ordinates to ZH; and let this line be also called the erect side (latus rectum), and $Z\Theta$ the transverse side.

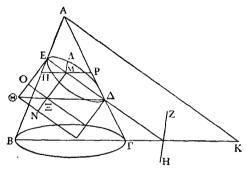

Prop. 13

Let a cone be cut by a plane through the axis, and let it be cut by another plane meeting each side of the axial triangle, being neither parallel to the base nor subcontrary, and let the plane containing the base of the cone meet the cutting plane in a straight line perpendicular either to the base of the axial triangle or to the base produced; then if a straight line be drawn from any point of the section of the cone parallel to the common section of the planes as far as the diameter of the section, its square will be equal to an area applied to a certain straight line; this line is such that the diameter of the section will bear to it the same ratio as the square on the line drawn from the vertex of the cone parallel to the diameter of the section as far as the base of the triangle bears to the rectangle contained by the intercepts made by it on the sides of the triangle; the breadth of the applied figure will be the intercept made by it on the diameter in the direction of the vertex of the section; and the applied figure will be deficient by a figure similar and similarly situated to the rectangle bounded by the diameter and the parameter; and let such a section be called an ellipse.

Let there be a cone, whose vertex is the point A

The erect and transverse side, that is to say, of the figure (είδοs) applied to the diameter. In the case of the parabola, the transverse side is infinite,

βάσις δὲ ὁ ΒΓ κύκλος, καὶ τετμήσθω ἐπιπέδω διὰ τοῦ ἄξονος, καὶ ποιείτω τομὴν τὸ ΑΒΓ τρίγωνον, τετμήσθω δε καὶ ετέρω επιπέδω συμπίπτοντι μεν εκατέρα πλευρά τοῦ διὰ τοῦ ἄξονος τριγώνου, μήτε δε παραλλήλω τῆ βάσει τοῦ κώνου μήτε ὑπεναντίως ἠγμένω, καὶ ποιείτω τομὴν ἐν τῆ ἐπιφανεία τοῦ κώνου τὴν ΔΕ γραμμήν κοινὴ

and whose base is the circle BT, and let it be cut by a plane through the axis, and let the section so made be the triangle AB Γ , and let it be cut by another plane meeting either side of the axial triangle, being drawn neither parallel to the base nor subcontrary, and let the section made on the surface of the cone be the curve ΔE ; let the common section of the cutting plane and of that containing the base of the cone be ZH, perpendicular to B Γ , and let the diameter of the section be E Δ , and from E let E θ be drawn perpendicular to $E\Delta$, and through A let AK be drawn parallel to E Δ , and let AK²: BK . KI = Δ E : E θ , and let any point Λ be taken on the section, and through Λ let ΛM be drawn parallel to ZH. I say that the square on AM is equal to an area applied to the straight line EO, having EM for its breadth, and being deficient by a figure similar to the rectangle contained by ΔE , $E\Theta$.

For let $\Delta\Theta$ be joined, and through M let MEN be

ΘΕ παράλληλος ήχθω ή ΜΞΝ, διὰ δὲ τῶν Θ, Ξ τη ΕΜ παράλληλοι ήχθωσαν αί ΘΝ, ΞΟ, καὶ διὰ τοῦ Μ τῆ ΒΓ παράλληλος ἤχθω ἡ ΠΜΡ. ἐπεὶ οὖν ἡ ΠΡ τῆ ΒΓ παράλληλός ἐστιν, ἔστι δὲ καὶ ἡ ΛΜ τῆ ΖΗ παράλληλος, τὸ ἄρα διὰ τῶν ΛΜ, ΠΡ ἐπίπεδον παράλληλόν ἐστι τῷ διὰ τῶν ΖΗ, ΒΓ ἐπιπέδω, τουτέστι τῆ βάσει τοῦ κώνου. ἐὰν ἄρα ἐκβληθῆ διὰ τῶν ΛΜ, ΠΡ ἐπίπεδον, ἡ τομὴ κύκλος ἔσται, οὖ διάμετρος ἡ ΠΡ. καί ἐστι κάθετος ἐπ' αὐτὴν ἡ ΛΜ' τὸ ἄρα ὑπὸ τῶν ΠΜΡ ἴσον ἐστὶ τῶ ἀπό τῆς ΛΜ. καὶ ἐπεί ἐστιν, ὡς τὸ ἀπὸ τῆς ΑΚ πρὸς τὸ ὑπὸ τῶν ΒΚΓ, οὕτως ἡ ΕΔ πρὸς τὴν ΕΘ, ὁ δὲ τοῦ ἀπὸ τῆς ΑΚ πρὸς τὸ ὑπὸ τῶν ΒΚΓ λόγος σύγκειται ἐκ τοῦ, ὃν ἔχει ἡ ΑΚ πρὸς ΚΒ, καὶ ἡ ΑΚ πρὸς ΚΓ, ἀλλ' ὡς μὲν ἡ ΑΚ πρὸς ΚΒ, οὕτως ή ΕΗ πρὸς ΗΒ, τουτέστιν ή ΕΜ πρὸς ΜΠ, ὡς δὲ ἡ ΑΚ πρὸς ΚΓ, οὕτως ἡ ΔΗ πρὸς ΗΓ, τουτέστιν ή ΔΜ πρὸς ΜΡ, ὁ ἄρα της ΔΕ πρός την ΕΘ λόγος σύγκειται έκ τε τοῦ της ΕΜ πρὸς ΜΠ καὶ τοῦ της ΔΜ πρὸς ΜΡ. δ δέ συγκείμενος λόγος έκ τε τοῦ, ὃν έχει ἡ ΕΜ πρὸς ΜΠ, καὶ ἡ ΔΜ πρὸς ΜΡ, ὁ τοῦ ὑπὸ τῶν ΕΜΔ ἐστι πρὸς τὸ ὑπὸ τῶν ΠΜΡ. ἔστιν ἄρα ὡς τὸ ὑπὸ τῶν ΕΜΔ πρὸς τὸ ὑπὸ τῶν ΠΜΡ, οὕτως ή ΔE πρὸς τὴν $E\Theta$, τουτέστιν ή ΔM πρὸς τὴν $M\Xi$. ώς δὲ ή ΔM πρὸς $M\Xi$, τῆς ME κοινοῦ ύψους λαμβανομένης, ούτως τὸ ὑπὸ ΔΜΕ πρὸς τὸ ύπὸ ΕΜΕ. καὶ ώς ἄρα τὸ ὑπὸ ΔΜΕ πρὸς τὸ ὑπὸ ΠΜΡ, οὖτως τὸ ὑπὸ ΔΜΕ πρὸς τὸ ὑπὸ ΞΜΕ. ίσον ἄρα ἐστὶ τὸ ὑπὸ ΠΜΡ τῷ ὑπὸ ΞΜΕ. τὸ δὲ ύπὸ Π΄ΜΡ ἴσον ἐδείχθη τῷ ἀπὸ τῆς ΛΜ· καὶ τὸ ύπὸ ΕΜΕ ἄρα ἐστὶν ἴσον τῶ ἀπὸ τῆς ΛΜ. ἡ ΛΜ 320

drawn parallel to ΘE , and through Θ , Ξ , let ΘN , ΞO be drawn parallel to E M, and through M let $\Pi M P$ be drawn parallel to ΠP . Then since ΠP is parallel to ΠP , and ΠM is parallel to ΠP , therefore the plane through ΠM , ΠP is parallel to the plane through ΠP [Eucl. xi. 15], that is to the base of the cone. If, therefore, the plane through ΠM , ΠP be produced, the section will be a circle with diameter ΠP [Prop. 4]. And ΠM is perpendicular to it; therefore

IIM . $MP = \Lambda M^2$.

And since $AK^2: BK \cdot K\Gamma = E\Delta : E\Theta$,

and $AK^2 : BK \cdot K\Gamma = (AK : KB)(AK : K\Gamma),$

while AK : KB = EH : HB

=EM: MII, [Eucl. vi. 4

and $AK : K\Gamma = \Delta H : H\Gamma$

 $=\Delta M : MP,$ (ibid.

therefore $\Delta E : E\Theta = (EM : M\Pi)(\Delta M : MP)$.

But $(EM : M\Pi)(\Delta M : MP) = EM \cdot M\Delta : \Pi M \cdot MP$.

Therefore

 $EM.M\Delta:\Pi M.MP = \Delta E:E\Theta$

 $=\Delta M: M\Xi.$ [ibid.

But $\Delta M : M\Xi = \Delta M \cdot ME : \Xi M \cdot ME$,

by taking a common height ME.

Therefore $\Delta M \cdot ME : HM \cdot MP = \Delta M \cdot ME : \Xi M \cdot ME$.

Therefore $\Pi M \cdot MP = \Xi M \cdot ME$. [Eucl. v. 9]

But $\Pi M \cdot MP = \Lambda M^2$,

as was proved;

and therefore $\Xi M \cdot ME = \Lambda M^2$.

VOL. II Y 321

ἄρα δύναται τὸ ΜΟ, ὁ παράκειται παρὰ τὴν ΘΕ, πλάτος ἔχον τὴν ΕΜ, ἐλλεῖπον εἴδει τῷ ΟΝ ὁμοίῳ ὅντι τῷ ὑπὸ Δ ΕΘ. καλείσθω δὲ ἡ μὲν τοιαύτη τομὴ ἔλλειψις, ἡ δὲ ΕΘ παρ' ἢν δύνανται αἱ καταγόμεναι ἐπὶ τὴν Δ Ε τεταγμένως, ἡ δὲ αὐτὴ καὶ ὀρθία, πλαγία δὲ ἡ Ε Δ .

ιδ'

Έὰν αἱ κατὰ κορυφὴν ἐπιφάνειαι ἐπιπέδω τμηθῶσι μὴ διὰ τῆς κορυφῆς, ἔσται ἐν ἑκατέρα τῶν ἐπιφανειῶν τομὴ ἡ καλουμένη ὑπερβολή, καὶ τῶν δύο τομῶν ἥ τε διάμετρος ἡ αὐτὴ ἔσται, καὶ παρὰδ δύνανται αἱ ἐπὶ τὴν διάμετρον καταγόμεναι παράλληλοι τῆ ἐν τῆ βάσει τοῦ κώνου εὐθεία ἴσαι, καὶ τοῦ εἴδους ἡ πλαγία πλευρὰ κοινὴ ἡ μεταξὺ τῶν κορυφῶν τῶν τομῶν. καλείσθωσαν δὲ αἱ τοιαῦται τομαὶ ἀντικείμεναι.

"Εστωσαν αὶ κατὰ κορυφὴν ἐπιφάνειαι, ὧν κορυφὴ τὸ A σημεῖον, καὶ τετμήσθωσαν ἐπιπέδω μὴ διὰ τῆς κορυφῆς, καὶ ποιείτω ἐν τῆ ἐπιφανεία τομὰς τὰς ΔEZ , $H\Theta K$. λέγω, ὅτι ἑκατέρα τῶν ΔEZ , $H\Theta K$ τομῶν ἐστιν ἡ καλουμένη ὑπερβολή.

^a Let p be the parameter of a conic section and d the corresponding diameter, and let the diameter of the section and the tangent at its extremity be taken as axes of co-ordinates (in general oblique). Then Props. 11-13 are equivalent to the Cartesian equations.

Therefore the square on ΛM is equal to MO, which is applied to OE, having EM for its breadth, and being deficient by the figure ON similar to the rectangle ΔE . E Θ . Let such a section be called an *eclipse*, let EO be called the parameter to the ordinates to ΔE , and let this line be called the erect side (latus rectum), and $E\Delta$ the transverse side.

Prop. 14

If the vertically opposite surfaces [of a double cone] be cut by a plane not through the vertex, there will be formed on each of the surfaces the section called a hyperboia, and the diameter of both sections will be the same and the parameter to the ordinates drawn parallel to the straight line in the base of the cone will be equal, and the transverse side of the figure will be common, being the straight line between the vertices of the sections; and let such sections be called opposite.

Let there be vertically opposite surfaces having the point A for vertex, and let them be cut by a plane not through the vertex, and let the sections so made on the surface be ΔEZ , $H\Theta K$. I say that each of the sections ΔEZ , $H\Theta K$ is the so-called hyperbola.

$$y^2 = px$$
 (the parabola),

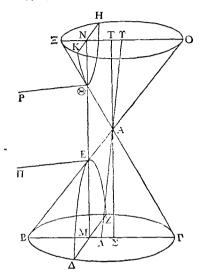

$$y^2 = px \pm \frac{p}{d}x^2$$
 (the hyperbola and ellipse respectively).

It is the essence of Apollonius's treatment to express the fundamental properties of the conics as equations between areas, whereas Archimedes had given the fundamental properties of the central conics as proportions

$$y^2:(a^2\pm x^2)=a^2:b^2$$
.

This form is, however, equivalent to the Cartesian equations referred to axes through the centre.

Έστω γὰρ ὁ κύκλος, καθ' οὖ φέρεται ἡ τὴν ἐπιφάνειαν γράφουσα εὐθεῖα, ὁ $\mathrm{B}\Delta\Gamma\mathrm{Z}$, καὶ ἤχθω

ἐν τῆ κατὰ κορυφὴν ἐπιφανεία παράλληλον αὐτῷ ἐπίπεδον τὸ ΞΗΟΚ· κοιναὶ δὲ τομαὶ τῶν ΗΘΚ, ΖΕΔ τομῶν καὶ τῶν κύκλων αἱ ΖΔ, ΗΚ· ἔσονται δὴ παράλληλοι. ἄξων δὲ ἔστω τῆς κωνικῆς ἐπιφανείας ἡ ΛΑΥ εὐθεῖα, κέντρα δὲ τῶν κύκλων τὰ Λ, Υ, καὶ ἀπὸ τοῦ Λ ἐπὶ τὴν ΖΔ κάθετος ἀχθεῖσα ἐκβεβλήσθω ἐπὶ τὰ Β, Γ σημεῖα, καὶ διὰ τῆς ΒΓ καὶ τοῦ ἄξονος ἐπίπεδον ἐκβεβλήσθω· ποιήσει δὴ τομὰς ἐν μὲν τοῖς κύκλοις παραλλήλους εὐθείας τὰς ΞΟ, ΒΓ, ἐν δὲ τῆ ἐπιφανεία τὰς ΒΑΟ, ΓΑΞ· 324

For let $B\Delta\Gamma Z$ be the circle round which revolves the straight line describing the surface, and in the vertically opposite surface let there be drawn parallel to it a plane ΞHOK ; the common sections of the sections $H\Theta K$, $ZE\Delta$ and of the circles [Prop. 4] will be $Z\Delta$, HK; and they will be parallel [Eucl. xi. 16]. Let the axis of the conical surface be $\Lambda\Lambda Y$, let the centres of the circles be Λ , Υ , and from Λ let a perpendicular be drawn to $Z\Delta$ and produced to the points B, Γ , and let the plane through $B\Gamma$ and the axis be produced; it will make in the circles the parallel straight lines ΞO , $B\Gamma$, and on the surface BAO, $\Gamma\Lambda\Xi$;

ἔσται δή καὶ ή ΞΟ τῆ ΙΙΚ πρὸς ὀρθάς, ἐπειδή καὶ ή ΒΓ τη ΖΔ έστι πρὸς ὀρθάς, καί έστιν έκατέρα παράλληλος. καὶ ἐπεὶ τὸ διὰ τοῦ ἄξονος ἐπίπεδον ταις τομαις συμβάλλει κατά τὰ Μ. Ν σημεία έντὸς τῶν γραμμῶν, δηλον, ώς καὶ τὰς γραμμὰς τέμνει τὸ ἐπίπεδον. τεμνέτω κατὰ τὰ Θ, Ε΄ τὰ ἄρα Μ, Ε, Θ, Ν σημεία έν τε τῶ διὰ τοῦ ἄξονός ἐστιν έπιπέδω καὶ ἐν τῶ ἐπιπέδω, ἐν ὧ εἰσιν αἱ γραμμαί: εὐθεῖα ἄρα ἐστὶν ἡ ΜΕΘΝ γραμμή. καὶ φανερόν, ότι τά τε Ε, Θ, Α, Γ ἐπ' εὐθείας ἐστὶ καὶ τὰ Β, Ε, Α, Ο· ἔν τε γὰρ τῆ κωνικῆ ἐπιφανεία ἐστὶ καὶ ἐν τῷ διὰ τοῦ ἄξονος ἐπιπέδῳ. ἤχθωσαν δὴ ἀπὸ $\mu \grave{\epsilon} \nu \tau \hat{\omega} \nu \Theta$, $\to \tau \hat{\eta} \Theta \to \pi \rho \grave{\delta} s \stackrel{\circ}{\delta \rho} \theta \grave{a} s \stackrel{\circ}{a} \stackrel{\circ}{\iota} \Theta \to \to 1$, $\delta \iota \grave{a}$ δέ τοῦ Α τῆ ΜΕΘΝ παράλληλος ἤχθω ἡ ΣΑΤ, καὶ πεποιήσθω, ώς μὲν τὸ ἀπὸ τῆς $A\Sigma$ πρὸς τὸ ὑπὸ $B\Sigma\Gamma$, οὕτως ἡ $\Theta Ε$ πρὸς $Ε\Pi$, ὡς δὲ τὸ ἀπὸ τῆς AT πρὸς τὸ ὑπὸ $OT\Xi$, οὕτως ἡ ΕΘ πρὸς ΘP. έπει οὖν κῶνος, οὖ κορυφή μεν τὸ Α σημεῖον, βάσις δε ό ΒΓ κύκλος, τέτμηται επιπέδω διά τοῦ άξονος, καὶ πεποίηκε τομὴν τὸ ΑΒΓ τρίγωνον, τέτμηται δὲ καὶ ἐτέρω ἐπιπέδω τέμνουτι τὴν βάσιν τοῦ κώνου κατ' εὐθεῖαν τὴν ΔΜΖ πρὸς ὀρθὰς οὖσαν τῆ ΒΓ, καὶ πεποίηκε τομὴν ἐν τῆ ἐπιφανεία τὴν ΔΕΖ, ή δε διάμετρος ή ΜΕ εκβαλλομένη συμπέπτωκε μια πλευρα τοῦ διὰ τοῦ ἄξονος τριγώνου έκτὸς τῆς κορυφῆς τοῦ κώνου, καὶ διὰ τοῦ Α σημείου τῆ διαμέτρω τῆς τομῆς τῆ ΕΜ παράλληλος $\hat{\eta}$ κται $\hat{\eta}$ $\hat{\Lambda}\Sigma$, καὶ $\hat{a}\pi\hat{o}$ το \hat{v} Ε τ $\hat{\eta}$ ΕΜ πρ \hat{o} s \hat{o} ρ $\theta\hat{a}$ s $\dot{\hat{\eta}}$ κται $\dot{\hat{\eta}}$ ΕΠ, καί ἐστιν ώς τὸ ἀπὸ $\Lambda \dot{\Sigma}$ πρὸς τὸ ὑπὸ $B \Sigma \Gamma$, οὕτως $\dot{\hat{\eta}}$ ΕΘ πρὸς ΕΠ, $\dot{\hat{\eta}}$ μὲν $\Delta E Z$ ἄρα τομή ὑπερβολή ἐστιν, ἡ δὲ ΕΠ παρ' ἣν δύνανται αἱ ἐπὶ τὴν ΕΜ καταγόμεναι τεταγμένως, πλαγία 326

now ΞO will be perpendicular to HK, since B Γ is perpendicular to $Z\Delta$, and each is parallel [Eucl. xi. 10]. And since the plane through the axis meets the sections at the points M, N within the curves, it is clear that the plane cuts the curves. Let it cut them at the points Θ , E; then the points M, E, Θ , N are both in the plane through the axis and in the plane containing the curves; therefore the line ME Θ N is a straight line [Eucl. xi. 3]. And it is clear that Ξ , Θ , A, Γ are on a straight line, and also B, E, A, O; for they are both on the conical surface and in the plane through the axis. Now let Θ P, EII be drawn from Θ , E perpendicular to Θ E, and through A let Σ AT be drawn parallel to ME Θ N, and let

 $A\Sigma^2:B\Sigma \cdot \Sigma\Gamma = \Theta E:E\Pi$,

and

 $AT^2: OT \cdot T\Xi = E\Theta : \ThetaP$.

Then since the cone, whose vertex is the point A and whose base is the circle B\Gamma, is cut by a plane through the axis, and the section so made is the triangle ABI', and it is cut by another plane cutting the base of the cone in the straight line ΔMZ perpendicular to B\Gamma, and the section so made on the surface is ΔEZ , and the diameter ME produced meets one side of the axial triangle beyond the vertex of the cone, and AS is drawn through the point A parallel to the diameter of the section EM, and EH is drawn from E perpendicular to EM, and AS2:BS.ST=E0:EH, therefore the section ΔEZ is a hyperbola, in which EH is the parameter to the ordinates to EM, and ΘE is the

δὲ τοῦ εἴδους πλευρὰ ἡ ΘΕ. ὁμοίως δὲ καὶ ἡ ΗΘΚ ὑπερβολή ἐστιν, ἡς διάμετρος μὲν ἡ ΘΝ, ἡ δὲ ΘΡ παρ' ἡν δύνανται αἱ ἐπὶ τὴν ΘΝ καταγόμεναι τεταγμένως, πλαγία δὲ τοῦ εἴδους πλευρὰ ἡ ΘΕ.

Αέγω, ὅτι ἴση ἐστὶν ἡ ΘΡ τῆ ΕΠ. ἐπεὶ γὰρ παράλληλός ἐστιν ἡ ΒΓ τῆ ΞΟ, ἔστιν ὡς ἡ ΑΣ πρὸς ΣΓ, οὕτως ἡ ΑΤ πρὸς ΤΞ, καὶ ὡς ἡ ΑΣ πρὸς ΣΒ, οὕτως ἡ ΑΤ πρὸς ΤΟ. ἀλλ' ὁ τῆς ΑΣ πρὸς ΣΓ λόγος μετὰ τοῦ τῆς ΑΣ πρὸς ΣΒ ὁ τοῦ ἀπὸ ΑΣ ἐστι πρὸς τὸ ὑπὸ ΒΣΓ, ὁ δὲ τῆς ΑΤ πρὸς ΤΕ μετὰ τοῦ τῆς ΑΤ πρὸς ΤΟ ὁ τοῦ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΞΤΟ· ἔστιν ἄρα ὡς τὸ ἀπὸ ΑΣ πρὸς τὸ ὑπὸ ΒΣΓ, οὕτως τὸ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΒΣΓ, οῦτως τὸ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΒΣΓ, ἡ ΘΕ πρὸς ΕΠ, ὡς δὲ τὸ ἀπὸ ΑΤ πρὸς τὸ ὑπὸ ΕΤΟ, ἡ ΘΕ πρὸς ΘΡ· καὶ ὡς ἄρα ἡ ΘΕ πρὸς ΕΠ, ἡ ΕΘ πρὸς ΘΡ· καὶ ὡς ἄρα ἡ ΘΕ πρὸς ΕΠ, ἡ ΕΘ πρὸς ΘΡ· ἴση ἄρα ἐστὶν ἡ ΕΠ τῆ ΘΡ.

(vi.) Transition to New Diameter

v'

'Εὰν ὑπερβολῆς ἢ ἐλλείψεως ἢ κύκλου περιφερείας εὐθεῖα ἐπιψαύουσα συμπίπτη τῆ διαμέτρω, καὶ διὰ τῆς ἀφῆς καὶ τοῦ κέντρου εὐθεῖα ἐκβληθῆ, ἀπὸ δὲ τῆς κορυφῆς ἀναχθεῖσα εὐθεῖα παρὰ τεταγμένως κατηγμένην συμπίπτη τῆ διὰ τῆς ἀφῆς καὶ

^a Apollonius is the first person known to have recognized the opposite branches of a hyperbola as portions of the same 328

transverse side of the figure [Prop. 12]. Similarly HOK is a hyperbola, in which ΘN is a diameter, ΘP is the parameter to the ordinates to ΘN , and ΘE is the transverse side of the figure.

I say that $\Theta P = E \Pi$. For since BT is parallel to ΞO ,

 $A\Sigma : \Sigma\Gamma = AT : T\Xi,$

and $A\Sigma : \Sigma B = AT : TO$.

But

 $(A\Sigma : \Sigma\Gamma)(A\Sigma : \Sigma B) = A\Sigma^2 : B\Sigma \cdot \Sigma\Gamma$

and $(AT : T\Xi)(AT : TO) = AT^2 : \Xi T . TO.$

Therefore $A\Sigma^2 : B\Sigma . \Sigma\Gamma = AT^2 : \Xi T . TO.$

But $A\Sigma^2 : B\Sigma : \Sigma\Gamma = \Theta E : E\Pi$, while $AT^2 : \Xi T : TO = \Theta E : \Theta P$;

therefore $\Theta E : E\Pi = E\Theta : \Theta P$.

Therefore $E\Pi = \Theta P.^a$ [Eucl. v. 9]

(vi.) Transition to New Diameter

Ibid., Prop. 50, Apoll. Perg. ed. Heiberg i. 148. 17-154. 8

Prop. 50

In a hyperbola, ellipse or circumference of a circle let a straight line be drawn to touch [the curve] and meet the diameter, and let the straight line through the point of contact and the centre be produced, and from the vertex let a straight line be drawn parallel to a straight line drawn ordinate-wise so as to meet the straight line drawn

curve. It is his practice, however, where possible to discuss the single-branch hyperbola (or the hyperbola *simpliciter* as he would call it) together with the ellipse and circle, and to deal with the opposite branches separately. But occasionally, as in i. 30, the double-branch hyperbola and the ellipse are included in one enunciation.

τοῦ κέντρου ἠγμένῃ εὐθείᾳ, καὶ ποιηθῆ, ὡς τὸ τμῆμα τῆς ἐφαπτομένης τὸ μεταξὺ τῆς ἀφῆς καὶ τῆς ἀνηγμένης πρὸς τὸ τμῆμα τῆς ἠγμένης διὰ τῆς ἀφῆς καὶ τοῦ κέντρου τὸ μεταξὺ τῆς ἀφῆς καὶ τῆς ἀνηγμένης, εὐθεῖά τις πρὸς τὴν διπλασίαν τῆς ἐφαπτομένης, ἥτις ἂν ἀπὸ τῆς τομῆς ἀχθῆ ἐπὶ τὴν διὰ τῆς άφῆς καὶ τοῦ κέντρου ἠγμένην εὐθεῖαν παράλληλος τῆ ἐφαπτομένη, δυνήσεταί τι χωρίον ὀρθογώνιον παρακείμενον παρὰ τὴν πορισθεῖσαν, πλάτος ἔχον τὴν ἀπολαμβανομένην ὑπὰ αὐτῆς πρὸς τῆ ἀφῆ, ἐπὶ μὲν τῆς ὑπερβολῆς ὑπερβάλλον εἴδει ὁμοίω τῷ περιεχομένω ὑπὸ τῆς διπλασίας τῆς μεταξὺ τοῦ κέντρου καὶ τῆς ἀφῆς καὶ τῆς πορισθείσης εὐθείας, ἐπὶ δὲ τῆς ἐλλείψεως καὶ τοῦ κύκλου ἐλλεῖπον.

"Εστω ὑπερβολὴ ἢ ἔλλειψις ἢ κύκλου περιφέρεια, ἡς διάμετρος ἡ ΑΒ, κέντρον δὲ τὸ Γ, ἐφαπτομένη δὲ ἡ ΔΕ, καὶ ἐπιζευχθεῖσα ἡ ΓΕ ἐκβεβλήσθω ἐφ' ἐκάτερα, καὶ κείσθω τῆ ΕΓ ἴση ἡ ΓΚ, καὶ διὰ τοῦ Β τεταγμένως ἀνήχθω ἡ ΒΖΗ, διὰ δὲ τοῦ Ε τῆ ΕΓ πρὸς ὀρθὰς ἤχθω ἡ ΕΘ, καὶ γινέσθω, ὡς ἡ ΖΕ πρὸς ΕΗ, οὕτως ἡ ΕΘ πρὸς τὴν διπλασίαν τῆς ΕΔ, καὶ ἐπιζευχθεῖσα ἡ ΘΚ ἐκβεβλήσθω, καὶ εἰλήφθω τι ἐπὶ τῆς τομῆς σημεῖον τὸ Λ, καὶ δι' αὐτοῦ τῆ ΕΔ παράλληλος ἤχθω ἡ ΛΜΞ, τῆ δὲ

^a To save space, the figure is here given for the hyperbola only; in the Mss. there are figures for the ellipse and circle as well.

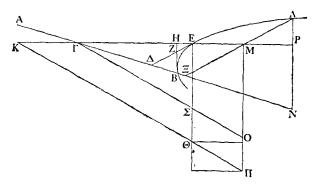

The general enunciation is not easy to follow, but the particular enunciation will make it easier to understand. The 330

through the point of contact and the centre, and let the segment of the tangent between the point of contact and the line drawn ordinate-nise bear to the segment of the line drawn through the point of contact and the centre between the point of contact and the line drann ordinatenise the same ratio as a certain straight line bears to double the tangent; then if any straight line be drawn from the section parallel to the tangent so as to meet the straight line drawn through the point of contact and the centre, its square will be equal to a certain rectilineal area applied to the postulated straight line, having for its breadth the intercept between it and the point of contact, in the case of the hyperbola exceeding by a figure similar to the rectangle bounded by double the straight line between the centre and the point of contact and the postulated straight line, in the case of the ellipse and circle falling short.a

In a hyperbola, ellipse or circumference of a circle, with diameter AB and centre Γ , let ΔE be a tangent, and let ΓE be joined and produced in either direction, and let IK be placed equal to EI, and through B let BZH be drawn ordinate-wise, and through E let $E\Theta$ be drawn perpendicular to $E\Gamma$, and let ZE: EH = E Θ : 2E Δ , and let Θ K be joined and produced, and let any point Λ be taken on the section. and through it let $\hat{\Lambda}M\Xi$ be drawn parallel to $E\Delta$ and purpose of this important proposition is to show that, if any other diameter be taken, the ordinate-property of the conic with reference to this diameter has the same form as the ordinate-property with reference to the original diameter. The theorem amounts to a transformation of co-ordinates from the original diameter and the tangent at its extremity to any diameter and the tangent at its extremity. In succeeding propositions, showing how to construct conics from certain data, Apollonius introduces the axes for the first time as special cases of diameters.

ΒΗ ή ΛΡΝ, τῆ δὲ ΕΘ ή ΜΠ. λέγω, ὅτι τὸ ἀπὸ ΛΜ ἴσον ἐστὶ τῶ, ὑπὸ ΕΜΠ.

"Ηχθω γὰρ διὰ τοῦ Γ τῆ ΚΠ παράλληλος ἡ ΓΣΟ. καὶ ἐπεὶ ἴση ἐστὶν ἡ ΕΓ τῆ ΓΚ, ὡς δὲ ἡ

ΕΓ πρὸς ΚΓ, ἡ ΕΣ πρὸς ΣΘ, ἴση ἄρα καὶ ἡ ΕΣ τῆ ΣΘ. καὶ ἐπεί ἐστιν, ὡς ἡ ΖΕ πρὸς ΕΗ, ἡ ΘΕ πρὸς τὴν διπλασίαν τῆς ΕΔ, καὶ ἐστι τῆς ΕΘ ἡμίσεια ἡ ΕΣ, ἔστιν ἄρα, ὡς ἡ ΖΕ πρὸς ΕΗ, ἡ ΣΕ πρὸς ΕΔ. ὡς δὲ ἡ ΖΕ πρὸς ΕΗ, ἡ ΛΜ πρὸς ΜΡ· ὡς ἄρα ἡ ΛΜ πρὸς ΜΡ, ἡ ΣΕ πρὸς ΕΔ. καὶ ἐπεὶ τὸ ΡΝΓ τρίγωνον τοῦ ΗΒΓ τριγώνον, τουτέστι τοῦ ΓΔΕ, ἐπὶ μὲν τῆς ὑπερβολῆς μεῖζον ἐδείχθη, ἐπὶ δὲ τῆς ἐλλείψεως καὶ τοῦ κύκλου ἔλασσον τῷ ΛΝΞ, κοινῶν ἀφαιρεθέντων ἐπὶ μὲν τῆς ὑπερβολῆς τοῦ τε ΕΓΔ τριγώνου καὶ τοῦ ΝΡΜΞ τετραπλεύρου, ἐπὶ δὲ τῆς ἐλλείψεως καὶ τοῦ κύκλου τοῦ ΜΕΓ τριγώνου, τὸ ΛΜΡ τρίγωνον τῷ ΜΕΔΕ τετραπλεύρου ἐστὶν ἴσον. καί ἐστι 332

APN parallel to BH, and let MII be drawn parallel to EO. I say that $\Lambda M^2 = EM$. MII.

For through Γ let $\Gamma\Sigma O$ be drawn parallel to KII. Then since

$$E\Gamma = \Gamma K$$

and $E\Gamma : \Gamma K = E\Sigma : \Sigma \Theta$, [Eucl. vi. 2]

therefore $E\Sigma = \Sigma\Theta$.

And since $ZE : EH = \ThetaE : 2E\Delta$,

and $E\Sigma = \frac{1}{2}E\Theta$,

therefore $ZE : EH = \Sigma E : E\Delta$.

But ZE : EH = AM : MP; [Eucl. vi. 4]

therefore $\Lambda M : MP = \Sigma E : E\Delta$.

And since it has been proved [Prop. 43] that in the hyperbola

triangle PN Γ = triangle HB Γ + triangle Λ N Ξ , i.e., triangle PN Γ = triangle $\Gamma\Delta$ E + triangle Λ N Ξ , while in the ellipse and the circle

triangle PN Γ = triangle HB Γ - triangle AN Ξ ,

i.e., triangle PNF + triangle $\Lambda N\Xi$ = triangle $\Gamma \Delta E,^b$ therefore by taking away the common elements—in the hyperbola the triangle $E\Gamma \Delta$ and the quadrilateral NPME, in the ellipse and the circle the triangle MEF,

triangle $\Lambda MP = quadrilateral ME \Delta \Xi$.

[•] For this step v. Eutocius's comment on Prop. 43.
• See Eutocius.

παράλληλος ή ΜΞ τῆ ΔΕ, ή δὲ ὑπὸ ΛΜΡ τῆ ὑπὸ ΕΜΞ ἐστιν ἴση· ἴσον ἄρα ἐστὶ τὸ ὑπὸ ΛΜΡ τῶ ύπὸ τῆς ΕΜ καὶ συναμφοτέρου τῆς ΕΔ, ΜΞ. καὶ έπεί έστιν, ώς ή MΓ πρὸς ΓΕ, ή τε ΜΞ πρὸς ΕΔ καὶ ή ΜΟ πρὸς ΕΣ, ώς ἄρα ή ΜΟ πρὸς ΕΣ, ή ΜΞ πρὸς ΔΕ. καὶ συνθέντι, ώς συναμφότερος ή ΜΟ, ΣΕ πρὸς ΕΣ, οὕτως συναμφότερος ή ΜΞ, ΕΔ πρὸς ΕΔ· ἐναλλάξ, ὡς συναμφότερος ἡ ΜΟ, ΣΕ πρὸς συναμφότερον τὴν ΞΜ, ΕΔ ή ΣΕ πρὸς ΕΔ. ἀλλ' ώς μὲν συναμφότερος ή ΜΟ, ΕΣ πρὸς συναμφότερον την ΜΞ, ΔΕ, τὸ ὑπὸ συναμφοτέρου της ΜΟ, ΕΣ καὶ της ΕΜ πρὸς τὸ ὑπὸ συναμφοτέρου της ΜΞ, ΕΔ καὶ της ΕΜ, ώς δὲ ή ΣΕ πρὸς ΕΔ, ή ΖΕ πρὸς ΕΗ, τουτέστιν ή ΛΜ πρὸς ΜΡ, τουτέστι τὸ ἀπὸ ΛΜ πρὸς τὸ ὑπὸ ΛΜΡ : ὡς ἄρα τὸ ὑπὸ συναμφοτέρου τῆς ΜΟ, ΕΣ καὶ τῆς ΜΕ πρὸς τὸ ὑπὸ συναμφοτέρου τῆς ΜΞ, ΕΔ καὶ τῆς ΕΜ, τὸ ἀπὸ ΛΜ πρὸς τὸ ὑπὸ ΛΜΡ. καὶ ἐναλλάξ, ώς τὸ ὑπὸ συναμφοτέρου τῆς ΜΟ, ΕΣ καὶ τῆς ΜΕ πρὸς τὸ ἀπὸ ΜΛ, οὕτως τὸ ὑπὸ συναμφοτέρου $\tau \hat{\eta}_S$ ME, E Δ καὶ $\tau \hat{\eta}_S$ ME $\pi \rho \hat{\delta}_S$ $\tau \hat{\delta}$ $\delta \pi \hat{\delta}$ AMP. ἴσον δὲ τὸ ὑπὸ ΛΜΡ τῷ ὑπὸ τῆς ΜΕ καὶ συναμφοτέρου της ΜΞ, ΕΔ. ἴσον ἄρα καὶ τὸ ἀπὸ ΛΜ τῶ ύπὸ ΕΜ καὶ συναμφοτέρου τῆς ΜΟ, ΕΣ. καί έστιν ή μèν ΣΕ τ $\hat{\eta}$ ΣΘ ἴση, ή δè ΣΘ τ $\hat{\eta}$ ΟΠ· ἴσον ἄρα τὸ ἀπὸ ΛΜ τῶ ὑπὸ ΕΜΠ.

But M Ξ is parallel to ΔE and angle AMP = angle $EM\Xi$ (Eucl. i. 15];

therefore $\Lambda M \cdot MP = EM \cdot (E\Delta + M\Xi)$.

And since $M\Gamma : \Gamma E = M\Xi : E\Delta$,

and $M\Gamma : \Gamma E = MO : E\Sigma$,

[Eucl. vi. 4

therefore $MO : E\Sigma = M\Xi : \Delta E$.

Componendo, $MO + \Sigma E : E\Sigma = M\Xi + E\Delta : E\Delta$;

and permutando

 $MO + \Sigma E : \Xi M + E \Delta = \Sigma E : E \Delta.$

But $MO + \Sigma E : \Xi M + E\Delta = (MO + E\Sigma) \cdot EM : (M\Xi + E\Delta) \cdot EM,$

and $\Sigma E : E\Delta = ZE : EH$

 $=\Lambda M:MP$

[Eucl. vi. 4

 $=\Lambda M^2 : \Lambda M . MP;$

therefore

 $(MO - E\Sigma)$, $ME : (M\Xi + E\Delta)$, $EM = AM^2 : AM$, MP.

And permutando

 $(MO + E\Sigma)$, $ME : M\Lambda^2 = (M\Xi + E\Delta)$, $ME : \Lambda M$, MP.

But $\Lambda M \cdot MP = ME \cdot (M\Xi + E\Delta)$;

therefore $\Lambda M^2 = EM \cdot (MO + E\Sigma)$.

And $\Sigma E = \Sigma \Theta$, while $\Sigma \Theta = OII$ [Eucl. i. 34];

therefore $\Lambda M^2 = EM \cdot M\Pi$.

Ibid. vii. 5-6, ed. Hultsch 640. 4-22

Τῆς δ' ᾿Αποτομῆς τοῦ λόγου βιβλίων ὅντων β πρότασίς ἐστιν μία ὑποδιηρημένη, διὸ καὶ μίαν πρότασιν οὕτως γράφω· διὰ τοῦ δοθέντος σημείου εὐθείαν γραμμὴν ἀγαγεῖν τέμνουσαν ἀπὸ τῶν τῆ θέσει δοθεισῶν δύο εὐθείῶν πρὸς τοῖς ἐπ' αὐτῶν δοθεῖσι σημείοις λόγον ἐχούσας τὸν αὐτὸν τῷ δοθέντι. τὰς δὲ γραφὰς διαφόρους γενέσθαι καὶ πλῆθος λαβεῖν συμβέβηκεν ὑποδιαιρέσεως γενομένης ἔνεκα τῆς τε πρὸς ἀλλήλας θέσεως τῶν διδομένων εὐθειῶν καὶ τῶν διαφόρων πτώσεων τοῦ διδομένου σημείου καὶ διὰ τὰς ἀναλύσεις καὶ συνθέσεις αὐτῶν τε καὶ τῶν διορισμῶν. ἔχει γὰρ τὸ μὲν πρῶτον βιβλίον τῶν Λόγου ἀποτομῆς

^a Unhappily the only work by Apollonius which has survived, in addition to the Conics, is On the Cutting-off of a 336

(b) OTHER WORKS

(i.) General

Pappus, Collection vii. 3, ed. Hultsch 636. 18-23

The order of the aforesaid books in the Treasury of Analysis is as follows: the one book of Euclid's Data, the two books of Apollonius's On the Cutting-off of a Ratio, his two books On the Cutting-off of an Area, his two books On Determinate Section, his two books On Tangencies, the three books of Euclid's Porisms. the two books of Apollonius's On Vergings, the two books of the same writer On Plane Loci, his eight books of Conics.^a

(ii.) On the Cutting-off of a Ratio Ibid. vii. 5-6. ed. Hultsch 610. 4-22

In the two books On the Cutting-off of a Ratio there is one enunciation which is subdivided, for which reason I state one enunciation thus: Through a given point to draw a straight line cutting off from two straight lines given in position intercepts, measured from two given points on them, which shall have a given ratio. When the subdivision is made, this leads to many different figures according to the position of the given straight lines in relation one to another and according to the different cases of the given point, and owing to the analysis and the synthesis both of these cases and of the propositions determining the limits of possibility. The first book of those On the Cutting-off of a

Ratio, and that only in Arabic. Halley published a Latin translation in 1706. But the contents of the other works are indicated fairly closely by Pappus's references.

τόπους ξ , πτώσεις $\overline{\kappa\delta}$, διορισμούς δὲ $\overline{\epsilon}$, \hat{w} ν τρεῖς μέν εἰσιν μέγιστοι, δύο δὲ ἐλάχιστοι. . . . τὸ δὲ δεύτερον βιβλίον Λόγου ἀποτομῆς ἔχει τόπους $\overline{\iota\delta}$, πτώσεις δὲ $\overline{\xi\gamma}$, διορισμούς δὲ τοὺς ἐκ τοῦ πρώτου ἀπάγεται γὰρ ὅλον εἰς τὸ πρῶτον.

(iii.) On the Cutting-off of an Area Ibid. vii. 7, ed. Hultsch 640. 26-642. 5

Τῆς δ' 'Αποτομῆς τοῦ χωρίου βιβλία μέν ἐστιν δύο, πρόβλημα δὲ κάν τούτοις εν ὑποδιαιρούμενον δίς, καὶ τούτων μία πρότασίς ἐστιν τὰ μὲν ἄλλα εμοίως ἔχουσα τῷ προτέρα, μόνω δὲ τούτω δια-ψέρουσα τῷ δεῖν τὰς ἀποτεμνομένας δύο εὐθείας ἐν ἐκείνη μὲν λόγον ἐχούσας δοθέντα ποιεῖν, ἐν δὲ ταύτη χωρίον περιεχούσας δοθέν.

(iv.) On Determinate Section

Ibid. vii. 9, ed. Hultsch 642. 19-644, 16

Έξης τούτοις ἀναδέδονται της Διωρισμένης τομης βιβλία β, ὧν ὁμοίως τοῖς πρότερον μίαν πρότασιν πάρεστιν λέγειν, διεζευγμένην δὲ ταύτην

^a The Arabic text shows that Apollonius first discussed the cases in which the lines are parallel, then the cases in which the lines intersect but one of the given points is at the point of intersection; in the second book he proceeds to the general case, but shows that it can be reduced to the case where one 338

Ratio contains seven loci, twenty-four cases and five determinations of the limits of possibility, of which three are maxima and two are minima. . . . The second book On the Cutting-off of a Ratio contains fourteen loci, sixty-three cases and the same determinations of the limits of possibility as the first; for they are all reduced to those in the first book.^a

(iii.) On the Cutting-off of an Area Ibid. vii. 7, ed. Hultsch 640. 26-642. 5

In the work On the Cutting-off of an Area there are two books, but in them there is only one problem, twice subdivided, and the one enunciation is similar in other respects to the preceding, differing only in this, that in the former work the intercepts on the two given lines were required to have a given ratio, in this to comprehend a given area.^b

(iv.) On Determinate Section

Ibid. vii. 9, ed. Hultsch 642. 19-644. 16

Next in order after these are published the two books On Determinate Section, of which, as in the previous cases, it is possible to state one comprehen-

of the given points is at the intersection of the two lines. By this means the problem is reduced to the application of a rectangle. In all cases Apollonius works by analysis and synthesis.

b Halley attempted to restore this work in his edition of the *De sectione rationis*. As in that treatise, the general case can be reduced to the case where one of the given points is at the intersection of the two lines, and the problem is reduced to the application of a certain rectangle.

τὴν δοθεῖσαν ἄπειρον εὐθεῖαν ἐνὶ σημείω τεμεῖν, ὥστε τῶν ἀπολαμβανομένων εὐθειῶν πρὸς τοῖς ἐπ' αὐτῆς δοθεῖσι σημείοις ἤτοι τὸ ἀπὸ μιᾶς τετράγωνον ἢ τὸ ὑπὸ δύο ἀπολαμβανομένων περιεχόμενον ὀρθογώνιον δοθέντα λόγον ἔχειν ἤτοι πρὸς τὸ ἀπὸ μιᾶς τετράγωνον ἢ πρὸς τὸ ὑπὸ μιᾶς ἀπολαμβανομένης καὶ τῆς ἔξω δοθείσης ἢ πρὸς τὸ ὑπὸ δύρ ἀπολαμβανομένων περιεχόμενον ὀρθογώνιον, ἐφ' ὁπότερα χρὴ τῶν δοθέντων σημείων. . . ἔχει δὲ τὸ μὲν πρῶτον βιβλίον προβλήματα ፳, ἐπιτάγματα τ̄ς, διορισμοὺς ἔ, ὧν μεγίστους μὲν δ, ἐλάχιστον δὲ ἔνα. . . . τὸ δὲ δεύτερον Διωρισμένης τομῆς ἔχει προβλήματα ϙ, ἐπιτάγματα θ, διορισμοὺς ϙ.

(v.) On Tangencies

Ibid. vii. 11, ed. Hultsch 644. 23-646. 19

Έξης δὲ τούτοις τῶν Ἐπαφῶν ἐστιν βιβλία δύο. προτάσεις δὲ ἐν αὐτοῖς δοκοῦσιν εἶναι πλείονες, ἀλλὰ καὶ τούτων μίαν τίθεμεν οὕτως ἔχουσαν έξης· σημείων καὶ εὐθειῶν καὶ κύκλων τριῶν ὁποιωνοῦν θέσει δοθέντων κύκλον ἀγαγεῖν δι' ἐκάστου τῶν δοθέντων σημείων, εἰ δοθείη, ἢ ἐφαπτόμενον ἑκάστης τῶν δοθεισῶν γραμμῶν. ταύτης διὰ

^a As the Greeks never grasped the conception of one point being two coincident points, it was not possible to enunciate this problem so concisely as we can do: Given four points A, B, C, D on a straight line, of which A may coincide with C and B with D, to find another point P on the same straight line such that $AP \cdot CP : BP \cdot DP$ has a given value. If $AP \cdot CP = \lambda \cdot BP \cdot DP$, where A, B, C, D, λ are given, the determination of P is equivalent to the solution of a quadratic equation, which the Greeks could achieve by means of the 340

sive enunciation thus: To cut a given infinite straight line in a point so that the intercepts between this point and given points on the line shall furnish a given ratio, the ratio being that of the square on one intercept, or the rectangle contained by two, towards the square on the remaining intercept, or the rectangle contained by the remaining intercept and a given independent straight line, or the rectangle contained by two remaining intercepts, whichever way the given points [are situated]. . . The first book contains six problems, sixteen subdivisions and five limits of possibility, of which four are maxima and one is a minimum. . . The second book On Determinate Section contains three problems, nine subdivisions, and three limits of possibility.^a

(v.) On Tangencies

Ibid. vii. 11, ed. Hultsch 644, 23-646, 19

Next in order are the two books On Tangencies. Their enunciations are more numerous, but we may bring these also under one enunciation thus stated: Given three entities, of which any one may be a point or a straight line or a circle, to draw a circle which shall pass through each of the given points, so far as it is points which are given, or to touch each of the given lines. In

application of areas. But the fact that limits of possibility, and maxima and minima were discussed leads Heath (H.G. M. ii. 180-181) to conjecture that Apollonius investigated the series of point-pairs determined by the equation for different values of λ , and that "the treatise contained what amounts to a complete Theory of Involution." The importance of the work is shown by the large number of lemmas which Pappus collected.

b The word "lines" here covers both the straight lines and the circles.

πλήθη τῶν ἐν ταῖς ὑποθέσεσι δεδομένων ὁμοίων η ἀνομοίων κατὰ μέρος διαφόρους προτάσεις άναγκαῖον γίνεσθαι δέκα· έκ τῶν τριῶν γὰρ άνομοίων γενών τριάδες διάφοροι ἄτακτοι γίνονται ήτοι γὰρ τὰ διδόμενα τρία σημεῖα ἢ τρεῖς είθειαι η δύο σημεία και εύθεια η δύο εύθειαι και σημείον η δύο σημεία καὶ κύκλος η δύο κύκλοι καὶ σημεῖον ἢ δύο εὐθεῖαι καὶ κύκλος ἢ δύο κύκλοι καὶ εὐθεῖα η σημεῖον καὶ εὐθεῖα καὶ κύκλος η τρείς κύκλοι. τούτων δύο μέν τὰ πρῶτα δέδεικται έν τῶ δ΄ βιβλίω τῶν πρώτων Στοιχείων, διὸ παρίει μὴ γράφων τὸ μὲν γὰρ τριῶν δοθέντων σημείων μη έπ' εὐθείας ὄντων τὸ αὐτό ἐστιν τῶ περὶ τὸ δοθέν τρίγωνον κύκλον περιγράψαι, τὸ δὲ 🦁 δοθεισών εὐθειών μη παραλλήλων οὐσών, ἀλλὰ τών τριών συμπιπτουσών, τὸ αὐτό ἐστιν τῷ εἰς τὸ δοθέν τρίγωνον κύκλον έγγράψαι τὸ δὲ δύο παραλλήλων οὐσῶν καὶ μιᾶς ἐμπιπτούσης ὡς μέρος ὂν της β΄ υποδιαιρέσεως προγράφεται έν τούτοις πάντων. καὶ τὰ έξῆς Ε έν τῷ πρώτω βιβλίω τὰ δὲ λειπόμενα δύο, τὸ δύο δοθεισῶν εὐθειῶν καὶ κύκλου η τριῶν δοθέντων κύκλων μόνον ἐν τῶ δευτέρω βιβλίω διὰ τὰς πρὸς ἀλλήλους θέσεις τῶν κύκλων τε καὶ εὐθειῶν πλείονας οὔσας καὶ πλειόνων διορισμών δεομένας.

^a Eucl. iv. 5 and 4.

b The last problem, to describe a circle touching three 342

this problem, according to the number of like or unlike entities in the hypotheses, there are bound to be, when the problem is subdivided, ten enunciations. For the number of different ways in which three entities can be taken out of the three unlike sets is For the given entities must be (1) three points or (2) three straight lines or (3) two points and a straight line or (4) two straight lines and a point or (5) two points and a circle or (6) two circles and a point or (7) two straight lines and a circle or (8) two circles and a straight line or (9) a point and a straight line and a circle or (10) three circles. Of these, the first two cases are proved in the fourth book of the first Elements, a for which reason they will not be described; for to describe a circle through three points, not being in a straight line, is the same thing as to circumscribe a given triangle, and to describe a circle to touch three given straight lines, not being parallel but meeting each other, is the same thing as to inscribe a circle in a given triangle; the case where two of the lines are parallel and one meets them is a subdivision of the second problem but is here given first place. The next six problems in order are investigated in the first book, while the remaining two, the case of two given straight lines and a circle and the case of three circles, are the sole subjects of the second book on account of the manifold positions of the circles and straight lines with respect one to another and the need for numerous investigations of the limits of possibility.b

given circles, has been investigated by many famous geometers, including Newton (Arithmetica Universalis, Prob. 47). The lemmas given by Pappus enable Heath (II.G.M. ii. 183-185) to restore Apollonius's solution—a "plane" solution depending only on the straight line and circle.

(vi.) On Plane Loci

Ibid, vii. 23, ed. Hultsch 662, 19-661, 7

Οί μεν οὖν ἀρχαῖοι εἰς τὴν τῶν ἐπιπέδων τούτων τόπων τάξιν ἀποβλέποντες ἐστοιχείωσαν: ἦς ἀμελήσαντες οἱ μετ' αὐτοὺς προσέθηκαν ἑτέρους, ὡς οὐκ ἀπείρων τὸ πλῆθος ὄντων, εἰ θέλοι τις προσγράφειν οὐ τῆς τάξεως ἐκείνης ἐχόμενα. θήσω οὖν τὰ μὲν προσκείμενα ὕστερα, τὰ δ' ἐκ τῆς τάξεως πρότερα μιᾳ περιλαβὼν προτάσει ταύτη:

Έὰν δύο εὐθεῖαι ἀχθωσιν ἤτοι ἀπὸ ένὸς δεδομένου σημείου ἢ ἀπὸ δύο καὶ ἤτοι ἐπ' εὐθείας ἢ παράλληλοι ἢ δεδομένην περιέχουσαι γωνίαν καὶ ἤτοι λόγον ἔχουσαι πρὸς ἀλλήλας ἢ χωρίον περιέχουσαι δεδομένον, ἄπτηται δὲ τὸ τῆς μιᾶς πέρας ἐπιπέδου τόπου θέσει δεδομένου, ἄψεται καὶ τὸ τῆς ἐτέρας πέρας ἐπιπέδου τόπου θέσει δεδομένου ότὲ μὲν τοῦ ὁμογενοῦς, ὁτὲ δὲ τοῦ ἐτέρου, καὶ ὁτὲ μὲν ὁμοίως κειμένου πρὸς τὴν εὐθεῖαν, ὁτὲ δὲ ἐναντίως. ταῦτα δὲ γίνεται παρὰ τὰς διαφορὰς τῶν ὑποκειμένων.

(vii.) On Vergings

Ibid. vii. 27-28, ed. Hultsch 670. 4-672. 3

Νεύειν λέγεται γραμμή ἐπὶ σημεῖον, ἐὰν ἐπεκβαλλομένη ἐπ' αὐτὸ παραγίνηται [. . .]

1 τούτων is attributed by Hultsch to dittography.

^b It is not clear what straight line is meant—probably the most obvious straight line in each figure.

These words follow the passage (quoted καργα, pp. 262-265) wherein Pappus divides loci into ἐφεκτικοί, διεξοδικοί and ἀναστροφικοί.

(vi.) On Plane Loci

Ibid. vii. 23, ed. Hultsch 662, 19-664, 7

The ancients had regard to the arrangement a of these plane loci with a view to instruction in the elements; heedless of this consideration, their successors have added others, as though the number could not be infinitely increased if one were to make additions from outside that arrangement. Accordingly I shall set out the additions later, giving first those in the arrangement, and including them in this single enunciation:

If two straight lines be drawn, from one given point or from two, which are in a straight line or parallel or include a given angle, and either bear a given ratio one towards the other or contain a given rectangle, then, if the locus of the extremity of one of the lines be a plane locus given in position, the locus of the extremity of the other will also be a plane locus given in position, which will sometimes be of the same kind as the former, sometimes of a different kind, and will sometimes be similarly situated with respect to the straight line, sometimes contrarivise. These different cases arise according to the differences in the suppositions.

(vii.) On Vergings a

Ibid. vii. 27-28, ed. Hultsch 670. 4-672. 3

A line is said to *lerge* to a point if, when produced, it passes through the point. [. . .] The general

^c Pappus proceeds to give seven other enunciations from the first book and eight from the second book. These have enabled reconstructions of the work to be made by Fermat, van Schooten and Robert Simson.

d Examples of vergings have already been encountered

several times; v. pp. 186-189 and vol. i. p. 244 n. a.

προβλήματος δὲ ὄντος καθολικοῦ τούτου· δύο δοθεισῶν γραμμῶν θέσει θεῖναι μεταξὺ τούτων εὐθεῖαν τῷ μεγέθει δεδομένην νεύουσαν ἐπὶ δοθὲν σημεῖον, ἐπὶ τούτου τῶν ἐπὶ μέρους διάφορα τὰ ὑποκείμενα ἐχόντων, ἃ μὲν ἢν ἐπίπεδα, ἃ δὲ στερεά, ἃ δὲ γραμμικά, τῶν δ' ἐπιπέδων ἀποκληρώσαντες τὰ πρὸς πολλὰ χρησιμώτερα ἔδειξαν τὰ προβλήματα ταῦτα·

Θέσει δεδομένων ήμικυκλίου τε καὶ εὐθείας πρός όρθὰς τῆ βάσει ἢ δύο ήμικυκλίων ἐπ' εὐθείας ἐχόντων τὰς βάσεις θεῖναι δοθεῖσαν τῷ μεγέθει εὐθεῖαν μεταξὺ τῶν δύο γραμμῶν νεύουσαν ἐπὶ

γωνίαν ήμικυκλίου.

Καὶ ρόμβου δοθέντος καὶ ἐπεκβεβλημένης μιᾶς πλευρᾶς άρμόσαι ὑπὸ τὴν ἐκτὸς γωνίαν δεδομένην τῷ μεγέθει εὐθεῖαν νεύουσαν ἐπὶ τὴν ἄντικρυς γωνίαν.

Καὶ θέσει δοθέντος κύκλου ἐναρμόσαι εὐθεῖαν

μεγέθει δεδομένην νεύουσαν ἐπὶ δοθέν.

problem is: Two straight lines being given in position, to place between them a straight line of given length so as to verge to a given point. When it is subdivided the subordinate problems are, according to differences in the suppositions, sometimes plane, sometimes solid, sometimes linear. Among the plane problems, a selection was made of those more generally useful, and these problems have been proved:

Given a semicircle and a straight line perpendicular to the base, or two semicircles with their bases in a straight line, to place a straight line of given length between the two lines and verging to an angle of the semicircle [or of one

of the semicircles];

Given a rhombus with one side produced, to insert a straight line of given length in the external angle so that it verges to the opposite angle;

Given a circle, to insert a chord of given length verging

to a given point.

- Of these, there are proved in the first book four cases of the problem of one semicircle and a straight line, two cases of the circle, and two cases of the rhombus; in the second book there are proved ten cases of the problem in which two semicircles are assumed, and in these there are numerous subdivisions concerned with limits of possibility according to the given length of the straight line.^a
- ^a A restoration of Apollonius's work On Vergings has been attempted by several writers, most completely by Samuel Horsley (Oxford, 1770). A lemma by Pappus enables Apollonius's construction in the case of the rhombus to be restored with certainty; v. Heath, H.G. M. ii. 190-192.

(viii.) On the Dodecahedron and the Icosahedron

Hypsicl. [Eucl. Elem. xiv.], Eucl. ed. Heiberg v. 6, 19-8, 5

Ο αὐτὸς κύκλος περιλαμβάνει τό τε τοῦ δωδεκαέδρου πεντάγωνον καὶ τὸ τοῦ εἰκοσαέδρου τρίγωνον τῶν εἰς τὴν αὐτὴν σφαῖραν ἐγγραφομένων. τοῦτο δὲ γράφεται ὑπὸ μὲν 'Αρισταίου ἐν τῷ ἐπιγραφομένω Τῶν ε̄ σχημάτων συγκρίσει, ὑπὸ δὲ 'Απολλωνίου ἐν τῆ δευτέρα ἐκδόσει τῆς Συγκρίσεως τοῦ δωδεκαέδρου πρὸς τὸ εἰκοσάεδρον, ὅτι ἐστίν, ώς ἡ τοῦ δωδεκαέδρου ἐπιφάνεια πρὸς τὴν τοῦ εἰκοσαέδρου ἐπιφάνειαν, οὕτως καὶ αὐτὸ τὸ δωδεκάεδρον πρὸς τὸ εἰκοσάεδρον διὰ τὸ τὴν αὐτὴν εἶναι κάθετον ἀπὸ τοῦ κέντρου τῆς σφαίρας ἐπὶ τὸ τοῦ δωδεκαέδρου πεντάγωνον καὶ τὸ τοῦ εἰκοσαέδρου τρίγωνον.

(viii.) On the Dodecahedron and the Icosahedron

Hypsicles [Euclid, *Elements* xiv.], ^a Eucl. ed. Heiberg v. 6, 19-8, 5

The pentagon of the dodecahedron and the triangle of the icosahedron b inscribed in the same sphere can be included in the same circle. For this is proved by Aristaeus in the work which he wrote On the Comparison of the Five Figures, and it is proved by Apollonius in the second edition of his work On the Comparison of the Dodecahedron and the Icosahedron that the surface of the dodecahedron bears to the surface of the icosahedron the same ratio as the volume of the dodecahedron bears to the volume of the icosahedron, by reason of there being a common perpendicular from the centre of the sphere to the pentagon of the dodecahedron and the triangle of the icosahedron.

(ix.) Principles of Mathematics

Marinus, Commentary on Euclid's Data, Eucl. ed. Heiberg vi. 234. 13-17

Therefore, among those who made it their aim to define the datum more simply and with a single differentia, some called it the assigned, such as Apollonius in his book On Vergings and in his

^a The so-called fourteenth book of Euclid's *Elements* is really the work of Hypsicles, for whom v. infra, pp. 394-397.
^b For the regular solids v. vol. i. pp. 216-225. The face of the dodecahedron is a pentagon and the face of the icosa-

hedron a triangle.

^c A proof is given by Hypsicles as Prop. 2 of his book. Whether the Aristaeus is the same person as the author of the Solid Loci is not known.

έν τῆ Καθόλου πραγματεία, οἱ δὲ γνώριμον, ώς Διόδορος.

(x.) On the Cochlias

Procl. in Eucl. i., ed. Friedlein 105. 1-6

Τὴν περὶ τὸν κύλινδρον ἔλικα γραφομένην, ὅταν εὐθείας κινουμένης περὶ τὴν ἐπιφάνειαν τοῦ κυλίνδρου σημεῖον ὁμοταχῶς ἐπ' αὐτῆς κινῆται. γίνεται γὰρ ἔλιξ, ῆς ὁμοιομερῶς πάντα τὰ μέρη πᾶσιν ἐφαρμόζει, καθάπερ ᾿Απολλώνιος ἐν τῷ Περὶ τοῦ κοχλίου γράμματι δείκνυσιν.

(xi.) On Unordered Irrationals

Procl. in Eucl. i., ed. Friedlein 74. 23-24

Τὰ Περὶ τῶν ἀτάκτων ἀλόγων, ἃ ὁ ᾿Απολλώνιος ἐπὶ πλέον ἐξειργάσατο.

Schol. i. in Eucl. Elem. x., Eucl. ed. Heiberg v. 414, 10-16

Έν μέν οὖν τοῖς πρώτοις περὶ συμμέτρων καὶ ἀσυμμέτρων διαλαμβάνει πρὸς τὴν φύσιν αὐτῶν αὐτὰ ἐξετάζων, ἐν δὲ τοῖς έξῆς περὶ ρητῶν καὶ ἀλόγων οὐ πασῶν· τινὲς γὰρ αὐτῷ ὡς ἐνιστάμενοι ἐγκαλοῦσιν· ἀλλὰ τῶν ἀπλουστάτων εἰδῶν, ὧν

^a Heath (*H.G.M.* ii. 192-193) conjectures that this work must have dealt with the fundamental principles of mathematics, and to it he assigns various remarks on such subjects attributed to Apollonius by Proclus, and in particular his attempts to prove the axioms. The different ways in which entities are said to be given are stated in the definitions quoted from Euclid's *Data* in vol. i. pp. 478-479.

APOLLONIUS OF PERGA

General Treatise, a others the known, such as Diodorus.

(x.) On the Cochlias

Proclus, On Euclid i., ed. Friedlein 105. 1-6

The cylindrical helix is described when a point moves uniformly along a straight line which itself moves round the surface of a cylinder. For in this way there is generated a helix which is homoeomeric, any part being such that it will coincide with any other part, as is shown by Apollonius in his work On the Cochlius.

(xi.) On Unordered Irrationals

Proclus, On Euclid i., ed. Friedlein 74. 23-24

The theory of unordered irrationals, which Apollonius fully investigated.

Euclid, Elements x., Scholium i., ed. Heiberg v. 414, 10-16

Therefore in the first [theorems of the tenth book] he treats of symmetrical and asymmetrical magnitudes, investigating them according to their nature, and in the succeeding theorems he deals with rational and irrational quantities, but not all, which is held up against him by certain detractors; for he dealt only with the simplest kinds, by the combination of which

Possibly Diodorus of Alexandria, for whom v. vol. i.

p. 300 and p. 301 n. b.

c In Studien uber Euklid, p. 170, Heiberg conjectured that this scholium was extracted from l'appus's commentary, and he has established his conjecture in Videnskabernes Nelskabs Skrifter, 6 Raekke, hist.-philos. Afd. ii. p. 236 seq. (1888).

συντιθεμένων γίνονται ἄπειροι ἄλογοι, ὧν τινας καὶ ὁ ᾿Απολλώνιος ἀναγράφει.

(xii.) Measurement of a Circle

Eutoc. Comm. in Archim. Dim. Circ., Archim. ed. Heiberg iii. 258, 16-22

'Ιστέον δέ, ὅτι καὶ 'Απολλώνιος ὁ Περγαῖος ἐν τῷ 'Ωκυτοκίῳ ἀπέδειξεν αὐτὸ δι' ἀριθμῶν ἑτέρων ἐπὶ τὸ σύνεγγυς μᾶλλον ἀγαγών. τοῦτο δὲ ἀκριβέστερον μὲν εἶναι δοκεῖ, οὐ χρήσιμον δὲ πρὸς τὸν 'Αρχιμήδους σκοπόν· ἔφαμεν γὰρ αὐτὸν σκοπὸν ἔχειν ἐν τῷδε τῷ βιβλίῳ τὸ σύνεγγυς εὐρεῖν διὰ τὰς ἐν τῷ βίῳ χρείας.

(xiii.) Continued Multiplications

Papp. Coll. ii. 17-21, ed. Hultsch 18, 23-24, 201

Τούτου δὴ προτεθεωρημένου πρόδηλον, πῶς ἔστιν τὸν δοθέντα στίχον πολλαπλασιάσαι καὶ εἰπεῖν τὸν γενόμενον ἀριθμὸν ἐκ τοῦ τὸν πρῶτον ἀριθμὸν ὅν εἴληφε τὸ πρῶτον τῶν γραμμάτων ἐπὶ τὸν δεύτερον ἀριθμὸν ὅν εἴληφε τὸ δεύτερον τῶν γραμμάτων πολλαπλασιασθῆναι καὶ τὸν γενόμενον ἐπὶ τὸν τρίτον ἀριθμὸν ὅν εἴληφε τὸ τρίτον γράμμα

The extensive interpolations are omitted.

^a Pappus's commentary on Eucl. Elem. x. was discovered in an Arabic translation by Woepcke (Mimoires présenties par divers sarans à l'Académie des sciences, 1856, xiv.). It contains several references to Apollonius's work, of which one is thus translated by Woepcke (p. 693): "Enfin, Apollonius distingua les especes des irrationnelles ordonnées, et 352

APOLLONIUS OF PERGA

an infinite number of irrationals are formed, of which latter Apollonius also describes some.⁴

(xii.) Measurement of a Circle

Entocius, Commentary on Archimedes' Measurement of a Circle, Archim. ed. Heiberg iii. 258, 16-22

It should be noticed, however, that Apollonius of Perga proved the same thing (sc. the ratio of the circumference of a circle to the diameter) in the Quick-deliverer by a different calculation leading to a closer approximation. This appears to be more accurate, but it is of no use for Archimedes' purpose; for we have stated that his purpose in this book was to find an approximation suitable for the everyday needs of life.

(xiii.) Continued Multiplications of

Pappus, Collection ii. 17-21, ed. Hultsch 18, 23-24, 20d

This theorem having first been proved, it is clear how to multiply together a given verse and to tell the number which results when the number represented by the first letter is multiplied into the number represented by the second letter and the product is multiplied into the number represented by the third

découvrit la science des quantités appelées (irrationnelles) inordonnées, dont il produisit un très-grand nombre par des methodes exactes."

h We do not know what the approximation was.

6 Heiberg (Apollon, Perg. ed. Heiberg n. 124, n. 1) suggests that these calculations were contained in the ΥΩκυτόκιον, but there is no definite evidence.

d The passages, chiefly detailed calculations, adjudged by

Hultsch to be interpolations are omitted.

καὶ κατὰ τὸ έξῆς περαίνεσθαι μεχρὶ τοῦ διεξοδεύεσθαι τὸν στίχον, δν εἶπεν ᾿Απολλώνιος ἐν ἀρχῆ οὕτως·

'Αρτέμιδος κλεῖτε κράτος ἔξοχον ἐννέα κοῦραι (τὸ δὲ κλεῖτέ φησιν ἀντὶ τοῦ ὑπομνήσατε).

'Επεὶ δὲ καὶ πυθμένες όμοῦ τῶν μετρουμένων ἀριθμῶν ὑπὸ ἐκατοντάδος καὶ τῶν μετρουμένων ὑπὸ δεκάδος εἰσὶν οἱ ὑποκείμενοι κί

 $\bar{a}\;\bar{\gamma}\;\bar{\beta}\;\bar{\gamma}\;\bar{a}\;\bar{\gamma}\;\bar{\beta}\;\bar{\varsigma}\;\bar{\delta}\;\bar{a}\\ \bar{\delta}\;\bar{a}\;\bar{\zeta}\;\bar{\beta}\;\bar{\gamma}\;\bar{a}\;\bar{\beta}\;\bar{\zeta}\;\varsigma\;\bar{\zeta}\;\bar{\zeta}\;\bar{\epsilon}\;\bar{\epsilon}\;\bar{\delta}\;\bar{\zeta}\;\bar{a}.$

⁶ Apollonius, it is clear from Pappus, had a system of tetrads for calculations involving big numbers, the unit being the myriad or fourth power of 10. The tetrads are called μυριάδες ἀπλαῖ, μυριάδες διπλαῖ, μυριάδες τριπλαῖ, simple myriads, double myriads, triple myriads and so on, by which are meant 10000, 10000, 10000 and so on. In the text of 354

APOLLONIUS OF PERGA

letter and so on in order until the end of the verse which Apollonius gave in the beginning, that is

'Αρτέμιδος κλείτε κράτος έξοχον έννέα κουραι

(where he says κλείτε for ὑπομνήσατε, recall to mind).

Since there are thirty-eight letters in the verse, of which ten, namely $\bar{\rho} \ \bar{\tau} \ \bar{\sigma} \ \bar{\tau} \ \bar{\rho} \ \bar{\tau} \ \bar{\sigma} \ \bar{\chi} \ \bar{\nu} \ \bar{\rho} \ (=100, 300, 200 300, 100, 300, 200, 600, 400, 100)$, represent numbers less than 1000 and divisible by 100, and seventeen, namely $\bar{\mu} \ \bar{\iota} \ \bar{\iota} \ \bar{\kappa} \ \bar{\lambda} \ \bar{\iota} \ \bar{\kappa} \ \bar{\sigma} \ \bar{\xi} \ \bar{\sigma} \ \bar{\nu} \ \bar{\nu} \ \bar{\nu} \ \bar{\kappa} \ \bar{\iota} \ (=40, 10, 70, 20, 30, 10, 20, 70, 60, 70, 70, 50, 50, 50, 20, 70, 10)$, represent numbers less than 100 and divisible by 10, while the remaining eleven, namely, $\bar{\alpha} \ \bar{\epsilon} \ \bar{\delta} \ \bar{\epsilon} \ \bar{\epsilon} \ \bar{\alpha} \ \bar{\epsilon} \ \bar{\epsilon} \ \bar{\alpha} \ \bar{\alpha} \ \bar{\epsilon} \ (=1, 5, 4, 5, 5, 1, 5, 5, 5, 1, 1)$, represent numbers less than 10, then if for those ten numbers we substitute an equal number of hundreds, and if for the seventeen numbers we similarly substitute seventeen tens, it is clear from the above arithmetical theorem, the twelfth, that the ten hundreds together with the seventeen tens make 10.100009.

And since the bases of the numbers divisible by 100 and those divisible by 10 are the following twenty-seven

Pappus they are sometimes abbreviated to μ^a , $\mu\beta$, μ^{γ} and so on.

From Pappus, though the text is defective, Apollonius's procedure in multiplying together powers of 10 can be seen to be equivalent to adding the indices of the separate powers of 10, and then dividing by 4 to obtain the power of the myriad which the product contains. If the division is exact, the number is the n-myriad, say, meaning 10000^n . If there is a remainder, 3, 2 or 1, the number is 1000, 100 or 10 times the n-myriad as the case may be.

άλλὰ καὶ τῶν ἐλασσόνων δεκάδος εἰσὶν τα, τουτέστιν ἀριθμοὶ οἱ

$\bar{a} \bar{\epsilon} \bar{\delta} \bar{\epsilon} \bar{\epsilon} \bar{a} \bar{\epsilon} \bar{\epsilon} \bar{\epsilon} \bar{a} \bar{a}$

έὰν τὸν ἐκ τούτων τῶν ια καὶ τὸν ἐκ τῶν κζ πυθμένων στερεὸν δι' ἀλλήλων πολλαπλασιάσωμεν, ἔσται ὁ στερεὸς μυριάδων τετραπλῶν ιθ καὶ τριπλῶν ˏςλς καὶ διπλῶν ˏηυπ.

Αὖται δὴ συμπολλαπλασιαζόμεναι ἐπὶ τὸν ἐκ τῶν ἐκατοντάδων καὶ δεκάδων στερεόν, τουτέστι τὰς προκειμένας μυριάδας ἐνναπλᾶς δέκα, ποιοῦσιν μυριάδας τρισκαιδεκαπλᾶς ρςς, δωδεκαπλᾶς τξη, ἐνδεκαπλᾶς δω.

(xiv.) On the Burning Mirror

Fragmentum mathematicum Bobiense 113, 28-83, ed. Belger, Hermes, xvi., 1881, 279-280 1

Οί μεν οὖν παλαιοὶ ὑπέλαβον τὴν ἔξαψιν ποιεῖσθαι περὶ τὸ κέντρον τοῦ κατόπτρου, τοῦτο δὲ ψεῦδος ᾿Απολλώνιος μάλα δεόντως . . . (ἐν τῷ) πρὸς τοὺς κατοπτρικοὺς ἔδειξεν, καὶ περὶ τίνα δὲ τόπον ἡ ἐκπύρωσις ἔσται, διασεσάφηκεν ἐν τῷ Περὶ τοῦ πυρίου.

¹ As amended by Heiberg, Zeitschrift für Mathematik und Physik, xxviii., 1883, hist. Abth. 124-125.

APOLLONIUS OF PERGA

while there are eleven less than ten, that is the

if we multiply together the solid number formed by these eleven with the solid number formed by the twenty-seven the result will be the solid number

$$19.10000^4 + 6036.10000^3 + 8480.10000^2$$

When these numbers are multiplied into the solid number formed by the hundreds and the tens, that is with 10.100009 as calculated above, the result is

$$196.10000^{13} + 368.10000^{12} + 4800.10000^{11}$$

(xiv.) On the Burning Mirror

Fragmentum mathematicum Bobiense 113. 28-33,° ed. Belger, Hermes, xvi., 1881, 279-280

The older geometers thought that the burning took place at the centre of the mirror, but Apollonius very suitably showed this to be false . . . in his work on mirrors, and he explained clearly where the kindling takes place in his works On the Burning Mirror.^b

^a This fragment is attributed to Anthemius by Heiberg, but its antiquated terminology leads Heath (H.G.M. ii. 194)

to suppose that it is much earlier.

^b Of Apollonius's other achievements, his solution of the problem of finding two mean proportionals has already been mentioned (vol. i. p. 267 n. b) and sufficiently indicated; for his astronomical work the reader is referred to Heath, H.G. M. ii. 195-196.

(a) CLASSIFICATION OF CURVES

Procl. in Eucl. i., ed. Friedlein 111. 1-112. 11

Διαιρεί δ' αὖ τὴν γραμμὴν ὁ Γέμινος¹ πρῶτον μὲν εἰς τὴν ἀσύνθετον καὶ τὴν σύνθετον—καλεί δὲ σύνθετον τὴν κεκλασμένην καὶ γωνίαν ποιοῦσαν—ἔπειτα τὴν ἀσύνθετον² εἴς τε τὴν σχηματοποιοῦσαν καὶ τὴν ἐπ' ἄπειρον ἐκβαλλομένην, σχῆμα λέγων ποιεῖν τὴν κυκλικήν, τὴν τοῦ θυρεοῦ, τὴν κιττοειδῆ, μὴ ποιεῖν δὲ τὴν τοῦ ὀρθογωνίου κώνου τομήν, τὴν τοῦ ἀμβλυγωνίου, τὴν κογχοειδῆ, τὴν εὐθεῖαν, πάσας τὰς τοιαύτας. καὶ πάλιν κατ' ἄλλον τρόπον τῆς ἀσυνθέτου γραμμῆς τὴν μὲν ἀπλῆν εἶναι, τὴν δὲ μικτήν, καὶ τῆς ἀπλῆς τὴν μὲν σχῆμα ποιεῖν ὡς τὴν κυκλικήν, τὴν δὲ ἀόριστον εἶναι ὡς τὴν εὐθεῖαν, τῆς δὲ μικτῆς τὴν μὲν ἐν τοῖς ἐπιπέδοις τὴν μὲν ἐν αὐτῆ συμπίπτειν ὡς τὴν κιττοειδῆ, τὴν δὸ ἐπ ἄπειρον ἐκβάλλεσθαι, τῆς δὲ ἐν στερεοῖς

XX. LATER DEVELOPMENTS IN GEOMETRY ^a

(a) CLASSIFICATION OF CURVES

Proclus, On Euclid i., ed. Friedlein 111. 1-112. 11

Geminus first divides lines into the incomposite and the composite, meaning by composite the broken line forming an angle; and then he divides the incomposite into those forming a figure and those extending without limit, including among those forming a figure the circle, the ellipse and the cissoid, and among those not forming a figure the parabola, the hyperbola, the conchoid, the straight line, and all such lines. Again, in another manner he says that some incomposite lines are simple, others mixed, and among the simple are some forming a figure, such as the circle, and others indeterminate, such as the straight line, while the mixed include both lines on planes and lines on solids, and among the lines on planes are lines meeting themselves, such as the cissoid, and others extending without limit, and among lines on solids are

the limits imposed by their methods, and the recorded additions to the corpus of Greek mathematics may be described as reflections upon existing work or "stock-taking." On the basis of geometry, however, the new sciences of trigonometry and mensuration were founded, as will be described, and the revival of geometry by Pappus will also be reserved for separate treatment.

τὴν μὲν κατὰ τὰς τομὰς ἐπινοεῖσθαι τῶν στερεῶν, τὴν δὲ περὶ τὰ στερεὰ ὑφίστασθαι. τὴν μὲν γὰρ ἔλικα τὴν περὶ σφαῖραν ἢ κῶνον περὶ τὰ στερεὰ ὑφεστάναι, τὰς δὲ κωνικὰς τομὰς ἢ τὰς σπειρικὰς ἀπὸ τοιᾶσδε τομῆς γεννᾶσθαι τῶν στερεῶν. ἐπινενοῆσθαι δὲ ταύτας τὰς τομὰς τὰς μὲν ὑπὸ Μεναίχμου τὰς κωνικάς, δ καὶ Ἐρατοσθένης ἱστορῶν λέγει· "μὴ δὲ Μεναιχμίους κωνοτομεῖν τριάδας" τὰς δὲ ὑπὸ Περσέως, δς καὶ τὸ ἐπίγραμμα ἐποίησεν ἐπὶ τῆ εὐρέσει—

Τρεῖς γραμμὰς ἐπὶ πέντε τομαῖς εύρὼν έλικώδεις Περσεὺς τῶν δ' ἔνεκεν δαίμονας ἱλάσατο.

αί μὲν δὴ τρεῖς τομαὶ τῶν κώνων εἰσὶν παραβολὴ καὶ ὕπερβολὴ καὶ ἔλλειψις, τῶν δὲ σπειρικῶν τομῶν ἡ μέν ἐστιν ἐμπεπλεγμένη, ἐοικυῖα τἢ τοῦ ἵππου πέδη, ἡ δὲ κατὰ τὰ μέσα πλατύνεται, ἐξ ἐκατέρου δὲ ἀπολήγει μέρους, ἡ δὲ παραμήκης οὖσα τῷ μὲν μέσῳ διαστήματι ἐλάττονι χρῆται, εὐρύνεται δὲ ἐφ' ἐκάτερα. τῶν δὲ ἄλλων μίξεων τὸ πλῆθος ἀπέραντόν ἐστιν καὶ γὰρ στερεῶν σχημάτων πλῆθός ἐστιν ἄπειρον καὶ τομαὶ αὐτῶν συνίστανται πολυειδεῖς.

Ibid., ed. Friedlein 356, 8-12

Καὶ γὰρ ᾿Απολλώνιος ἐφ' ἐκάστης τῶν κωνικῶν γραμμῶν τί τὸ σύμπτωμα δείκνυσι, καὶ ὁ Νικομήδης ἐπὶ τῶν κογχοειδῶν, καὶ ὁ Ἱππίας ἐπὶ

¹ έλικώδεις Knoche, εύρων τὰς σπειρικάς λέγων codd.

v. vol. i. pp. 296-297.
 For Perseus, v. p. 364 n. a and p. 365 n. b.

lines conceived as formed by sections of the solids and lines formed round the solids. The helix round the sphere or cone is an example of the lines formed round solids, and the conic sections or the spiric curves are generated by various sections of solids. Of these sections, the conic sections were discovered by Menaechmus, and Eratosthenes in his account says: "Cut not the cone in the triads of Menaechmus" a; and the others were discovered by Perseus, b who wrote an epigram on the discovery—

Three spiric lines upon five sections finding, Perseus thanked the gods therefor.

Now the three conic sections are the parabola, the hyperbola and the ellipse, while of the spiric sections one is *interlaced*, resembling the horse-fetter, another is widened out in the middle and contracts on each side, a third is elongated and is narrower in the middle, broadening out on either side. The number of the other mixed lines is unlimited; for the number of solid figures is infinite and there are many different kinds of section of them.

Ibid., ed. Friedlein 356. 8-12

For Apollonius shows for each of the conic curves what is its property, as does Nicomedes for the

τῶν τετραγωνιζουσῶν, καὶ ὁ Π ερσεὺς ἐπὶ τῶν σπειρικῶν.

Ibid., ed. Friedlein 119. 8-17

*Ο δὲ συμβαίνειν φαμὲν κατὰ τὴν σπειρικὴν ἐπιφάνειαν· κατὰ γὰρ κύκλου νοεῖται στροφὴν ὀρθοῦ διαμένοντος καὶ στρεφομένου περὶ τὸ αὐτὸ σημεῖον, δ μή ἐστι κέντρον τοῦ κύκλου, διὸ καὶ τριχῶς ἡ σπείρα γίνεται, ἢ γὰρ ἐπὶ τῆς περιφερείας ἐστὶ τὸ κέντρον ἢ ἐντὸς ἤ ἐκτός. καὶ εἰ μὲν ἐπὶ τῆς περιφερείας ἐστὶ τὸ κέντρον, γίνεται σπείρα συνεχής, εἰ δὲ ἐντός, ἡ ἐμπεπλεγμένη, εἰ δὲ ἐκτός, ἡ διεχής. καὶ τρεῖς αἱ σπειρικαὶ τομαὶ κατὰ τὰς τρεῖς ταύτας διαφοράς.

Nicomedes appears to have flourished between Eratosthenes and Apollonius. He is known only as the inventor of the conchoid, which has already been fully described (vol. i.

pp. 298-309).

It is convenient to recall here that about a century later flourished Diocles, whose discovery of the cissoid has already been sufficiently noted (vol. i. pp. 270-279). He has also been referred to as the author of a brilliant solution of the problem of dividing a cone in a given ratio, which is equivalent to the solution of a cubic equation (supra, p. 162 n. a). The Dionysodorus who solved the same problem (ibid.) may have been the Dionysodorus of Caunus mentioned in the Herculaneum Roll, No. 1044 (so W. Schmidt in Bibliotheca mathematica, iv. pp. 321-325), a younger contemporary of Apollonius; he is presumably the same person as the 364

^a Obviously the work of Perseus was on a substantial scale to be associated with these names, but nothing is known of him beyond these two references. He presumably flourished after Euclid (since the conic sections were probably well developed before the spiric sections were tackled) and before Geminus (since Proclus relies on Geminus for his knowledge of the spiric curves). He may therefore be placed between 300 and 75 B.C.

conchoid and Hippias for the quadratices and Perseus for the spiric curves.^a

Ibid., ed. Friedlein 119. 8-17

We say that this is the case with the spiric surface; for it is conceived as generated by the revolution of a circle remaining perpendicular [to a given plane] and turning about a fixed point which is not its centre. Hence there are three forms of spire according as the centre is on the circumference, or within it, or without. If the centre is on the circumference, the spire generated is said to be continuous, if within interlaced, and if without open. And there are three spiric sections according to these three differences.^b

Dionysodorus mentioned by Heron, Metrica ii. 13 (cited infra, p. 481), as the author of a book On the Spire.

b This last sentence is believed to be a slip, perhaps due to too hurried transcription from Geminus. At any rate, no satisfactory meaning can be obtained from the sentence as it stands. Tannery (Mémoires scientifiques ii. pp. 24-28) interprets Perseus' epigram as meaning "three curves in addition to five sections." He explains the passages thus: Let a be the radius of the generating circle, c the distance of the centre of the generating circle from the axis of revolution, d the perpendicular distance of the plane of section (assumed to be parallel to the axis of revolution) from the axis of revolution. Then in the open spire, in which c>a, there are five different cases:

- (1) c+a>d>c. The curve is an oval.
- (2) d = c. Transition to (3).
- (3) c>d>c-a. The curve is a closed curve narrowest in the middle.
- (4) d=c-a. The curve is the hippopede (horse-fetter), which is shaped like the figure of 8 (v. vol. i. pp. 414-415 for the use of this curve by Eudoxus).
- (5) c-a>d>0. The section consists of two symmetrical ovals.

Tannery identifies the "five sections" of Perseus with these five types of section of the open spire; the three curves

(b) Attempts to Prove the Parallel Postulate

(i.) General

Procl. in Eucl. i., ed. Friedlein 191. 16-193. 9

"Καὶ ἐὰν εἰς δύο εὐθείας εὐθεία ἐμπίπτουσα τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας δύο ὀρθῶν ἐλάττονας ποιῆ, ἐκβαλλομένας τὰς εὐθείας ἐπ' ἄπειρον συμπίπτειν, ἐφ' ἃ μέρη εἰσὶν αἱ τῶν δύο

ορθών ελάττονες."

Τοῦτο καὶ παντελῶς διαγράφειν χρὴ τῶν αἰτημάτων θεώρημα γάρ ἐστι, πολλὰς μὲν ἀπορίας
ἐπιδεχόμενον, ἃς καὶ ὁ Πτολεμαῖος ἔν τινι βιβλίω

τῶν δύο ὀρθῶν αὐτόθεν τὴν πίστιν παρεχόμενον

Further passages on the spire by Heron, including a formula for its volume, are given *infra*, pp. 476-483.

^a Eucl. i. Post. 5, for which v. vol. i. pp. 442-443, especially

Aristotle (Anal. Prior. ii. 16, 65 a 4) alludes to a petitio principii current in his day among those who "think they establish the theory of parallels "—τὰς παραλλήλους γράφευ. As Heath notes (The Thirteen Books of Euclid's Elements, 366

described by Proclus are (1), (3) and (4). When the spire is continuous or closed, c=a and there are only three sections corresponding to (1), (2) and (3); (4) and (5) reduce to two equal circles touching one another. But the interlaced spire, in which c < a, gives three new types of section, and in these Tannery sees his "three curves in addition to five sections." There are difficulties in the way of accepting this interpretation, but no better has been proposed.

(b) Attempts to Prove the Parallel Postulate

(i.) General

Proclus. On Euclid i., ed. Friedlein 191, 16-193, 9

"If a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the two straight lines, if produced indefinitely, meet on that side on which are the angles less than two

right angles." a

This ought to be struck right out of the Postulates; for it is a theorem, and one involving many difficulties, which Ptolemy set himself to resolve in one of his books, and for its proof it needs a number of definitions as well as theorems. Euclid actually proves its converse as a theorem. Possibly some would erroneously consider it right to place this assumption among the Postulates, arguing that, as the angles are less than two right angles, there is

vol. i. pp. 191-192), Philoponus's comment on this passage suggests that the *petitio principii* lay in a *direction* theory of parallels. Euclid appears to have admitted the validity of the criticism and, by *assuming* his famous postulate once and

for all, to have countered any logical objections.

Nevertheless, as the extracts here given will show, ancient geometers were not prepared to accept the undemonstrable character of the postulate. Attempts to prove it continued to be made until recent times, and are summarized by R. Bonola, "Sulla teoria delle parallele e sulle geometrie non-euclidee" in Questioni riguardanti la geometria elementare, and by Heath, loc. cit., pp. 204-219. The chapter on the subject in W. Rouse Ball's Mathematical Essays and Recreations, pp. 307-326, may also be read with profit. Attempts to prove the postulate were abandoned only when it was shown that, by not conceding it, alternative geometries could be built.

της των εὐθειών συνεύσεως καὶ συμπτώσεως. πρὸς οὖς ὁ Γεμίνος ὀρθῶς ἀπήντησε λέγων ὅτι παρ' αὐτῶν ἐμάθομεν τῶν τῆς ἐπιστήμης ταύτης ἡγεμόνων μὴ πάνυ προσέχειν τὸν νοῦν ταίς πιθαναις φαντασίαις είς την των λόγων των έν γεωμετρία παραδοχήν. ὅμοιον γάρ φησι καὶ ᾿Αριστοτέλης ρητορικὸν ἀποδείξεις ἀπαιτεῖν καὶ νεωμέτρου πιθανολογοῦντος ἀνέχεσθαι, καὶ ὁ παρὰ τῷ Πλάτωνι Σιμμίας, ὅτι '' τοῖς ἐκ τῶν εἰκότων τὰς ἀποδείξεις ποιουμένοις σύνοιδα οὖσιν ἀλαζόσι.'' κάνταθθα τοίνυν το μέν ηλαττωμένων των δρθων συνεύειν τὰς εὐθείας ἀληθὲς καὶ ἀναγκαῖον, τὸ δὲ συνευούσας ἐπὶ πλέον ἐν τῷ ἐκβάλλεσθαι συμ-πεσεῖσθαί ποτε πιθανόν, ἀλλ' οὐκ ἀναγκαῖον, εἰ μή τις ἀποδείξειεν λόγος, ὅτι ἐπὶ τῶν εὐθειῶν τοῦτο ἀληθές. τὸ γὰρ εἶναί τινας γραμμὰς συνιούσας μὲν ἐπ' ἄπειρον, ἀσυμπτώτους δὲ ὑπαρχούσας, καίτοι δοκοῦν ἀπίθανον εἶναι καὶ παράδοξον, ὅμως ἀληθές ἐστι καὶ πεφώραται ἐπ' άλλων είδων της γραμμης. μήποτε οξν τοῦτο καὶ ἐπὶ τῶν εὐθειῶν δυνατόν, ὅπερ ἐπ' ἐκείνων τῶν γραμμῶν; ἕως γὰρ ἂν δι' ἀποδείξεως αὐτὸ καταδησώμεθα, περισπᾳ τὴν φαντασίαν τὰ ἐπ' ἄλλων δεικνύμενα γραμμῶν. εἰ δὲ καὶ οἱ διαμφισβητοῦντες λόγοι πρὸς τὴν σύμπτωσιν πολύ τὸ πληκτικον ἔχοιεν, πῶς οὐχὶ πολλῷ πλέον ἂν τὸ πιθανὸν τοῦτο καὶ τὸ ἄλογον ἐκβάλλοιμεν τῆς ήμετέρας παραδοχής;

''Αλλ' ὅτι μὲν ἀπόδειξιν χρὴ ζητεῖν τοῦ προκειμένου θεωρήματος δῆλον ἐκ τούτων, καὶ ὅτι

^a For Geminus, v. infra, p. 370 n. c.

immediate reason for believing that the straight lines converge and meet. To such, Geminus a rightly rejoined that we have learnt from the pioneers of this science not to incline our mind to mere plausible imaginings when it is a question of the arguments to be used in geometry. For Aristotle b says it is as reasonable to demand scientific proof from a rhetorician as to accept mere plausibilities from a geometer, and Simmias is made to say by Plato that he "recognizes as quacks those who base their proofs on probabilities." In this case the convergence of the straight lines by reason of the lessening of the right angles is true and necessary, but the statement that, since they converge more and more as they are produced, they will some time meet is plausible but not necessary, unless some argument is produced to show that this is true in the case of straight lines. For the fact that there are certain lines which converge indefinitely but remain non-secant, although it seems improbable and paradoxical, is nevertheless true and well-established in the case of other species of lines. May not this same thing be possible in the case of straight lines as happens in the case of those other lines? For until it is established by rigid proof, the facts shown in the case of other lines may turn our minds the other way. And though the controversial arguments against the meeting of the two lines should contain much that is surprising, is that not all the more reason for expelling this merely plausible and irrational assumption from our accepted teaching?

It is clear that a proof of the theorem in question must be sought, and that it is alien to the special

τῆς τῶν αἰτημάτων ἐστὶν ἀλλότριον ἰδιότητος, πῶς δὲ ἀποδεικτέον αὐτὸ καὶ διὰ ποίων λόγων ἀναιρετέον τὰς πρὸς αὐτὸ φερομένας ἐνστάσεις, τηνικαῦτα λεκτέον, ἡνίκα ᾶν καὶ ὁ στοιχειωτὴς αὐτοῦ μέλλη ποιεῖσθαι μνήμην ὡς ἐναργεῖ προσχρώμενος. τότε γὰρ ἀναγκαῖον αὐτοῦ δεῖξαι τὴν ἐνάργειαν οὐκ ἀναποδείκτως προφαινομένην ἀλλὰ δι' ἀποδείξεων γνώριμον γιγνομένην.

(ii.) Posidonius and GeminusIbid., ed. Friedlein 176. 5-10

Καὶ ὁ μὲν Εὐκλείδης τοῦτον ὁρίζεται τὸν τρόπον τὰς παραλλήλους εὐθείας, ὁ δὲ Ποσειδώνιος, παράλληλοι, φησίν, εἰσὶν αὶ μήτε συνεύουσαι μήτε ἀπονεύουσαι ἐν ἐνὶ ἐπιπέδω, ἀλλ' ἴσας ἔχουσαι

a i.e., Eucl. i. 28.

* Posidonius was a Stoic and the teacher of Cicero; he was born at Apamea and taught at Rhodes, flourishing 151–135 в.с. He contributed a number of definitions to elementary geometry, as we know from Proclus, but is more famous for a geographical work On the Ocean (lost but copiously quoted by Strabo) and for an astronomical work Περὶ μετεώρων. In this he estimated the circumference of the earth (v. supra, p. 267) and he also wrote a separate work on the size of the sun.

⁶ As with so many of the great mathematicians of antiquity, we know practically nothing about Geminus's life, not even his date, birthplace or the correct spelling of his name. As he wrote a commentary on Posidonius's Περὶ μετεώρων, we have an upper limit for his date, and "the view most generally accepted is that he was a Stoic philosopher, born probably in the island of Rhodes, and a pupil of Posidonius, and that he wrote about 73–67 в.с." (Heath, H.G.M. ii. 223). Further details may be found in Manitius's edition of the so-called Gemini elementa astronomiae.

Geminus wrote an encyclopaedic work on mathematics 370

character of the Postulates. But how it should be proved, and by what sort of arguments the objections made against it may be removed, must be stated at the point where the writer of the *Elements* is about to recall it and to use it as obvious.^a Then it will be necessary to prove that its obvious character does not appear independently of proof, but by proof is made a matter of knowledge.

(ii.) Posidonius b and Geminus c

Ibid., ed. Friedlein 176. 5-10

Such is the manner in which Euclid defines parallel straight lines, but Posidonius says that parallels are lines in one plane which neither converge nor diverge

which is referred to by ancient writers under various names, but that used by Eutocius ($T_{\alpha\nu}^{\omega} \mu a \theta \eta \mu a \tau \omega \nu \theta \epsilon \omega \rho (a, v. supra, pp. 280-281)$ was most probably the actual title. It is unfortunately no longer extant, but frequent references are made to it by Proclus, and long extracts are preserved in an

Arabic commentary by an-Nairīzī.

It is from this commentary that Geminus is known to have attempted to prove the parallel-postulate by a definition of parallels similar to that of Posidonius. The method is reproduced in Heath, H.G.M. ii. 228-230. It tacitly assumes "Playfair's axiom," that through a given point only one parallel can be drawn to a given straight line; this axiom -which was explicitly stated by Proclus in his commentary on Eucl. i. 30 (Procl. in Eucl. i., ed. Friedlein 374, 18-375, 3) is, in fact, equivalent to Euclid's Postulate 5. Saccheri noted an even more fundamental objection, that, before Geminus's definition of parallels can be used, it has to be proved that the locus of points equidistant from a straight line is a straight line; and this cannot be done without some equivalent postulate. Nevertheless, Geminus deserves to be held in honour as the author of the first known attempt to prove the parallel-postulate, a worthy predecessor to Lobachewsky and Riemann.

Ibid., ed. Friedlein 362. 12-363. 18

How the writer of the *Elements* proves that, if the interior angles be equal to two right angles, the straight lines are parallel is clear from what has been written. But Ptolemy, in the work b in which he attempted to prove that straight lines produced from angles less than two right angles will meet on the side on which the angles are less than two right angles, first proved this theorem, that if the interior angles be equal to two right angles the lines are parallel, and he proves it somewhat after this fashion.

Let the two straight lines be AB, $\Gamma\Delta$, and let any straight line EZH Θ cut them so as to make the angles BZH and ZH Δ equal to two right angles. I say that the straight-lines are parallel, that is they are non-

^b This work is not otherwise known.

"Ηδη μέν οὖν καὶ ἄλλοι τινὲς ώς θεώρημα προτάξαντες τοῦτο αἴτημα παρὰ τῷ Στοιχειωτῆ ληφθέν αποδείξεως ηξίωσαν. δοκεί δε και ο Πτολεμαίος

a There is a Common Notion to this effect interpolated in the text of Euclid; v. vol. i. pp. 411 and 445 n. a.

b The argument would have been clearer if it had been proved that the two interior angles on one side of ZH were severally equal to the two interior angles on the other side, that is $BZH = \Gamma HZ$ and $\Delta HZ = AZH$; whence, if ZA, $H\Gamma$ meet at A, the triangle ZHA can be rotated about the mid-374

secant. For, if it be possible, let BZ, $H\Delta$, when produced, meet at K. Then since the straight line HZ stands on AB, it makes the angles AZH, BZH equal to two right angles [Eucl. i. 13]. Similarly, since HZ stands on $\Gamma\Delta$, it makes the angles Γ HZ, Δ HZ equal to two right angles [ibid.]. Therefore the four angles AZH, BZH, ΓHZ, ΔHZ are equal to four right angles, and of them two, BZH, $ZH\Delta$, are by hypothesis equal to two right angles. Therefore the remaining angles AZH, THZ are also themselves equal to two right angles. If then, the interior angles being equal to two right angles, ZB, H\D meet at K when produced, ZA, HT will also meet when produced. For the angles AZH, THZ are also equal to two right angles. Therefore the straight lines will either meet on both sides or on neither, since these angles also are equal to two right angles. Let ZA, $H\Gamma$ meet, then, at Λ . Then the straight lines ΛABK , ΛΓΔK enclose a space, which is impossible.^a Therefore it is not possible that, if the interior angles be equal to two right angles, the straight lines should meet. Therefore they are parallel.

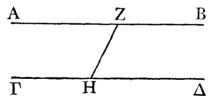

Ibid., ed. Friedlein 365. 5-367. 27

Therefore certain others already classed as a theorem this postulate assumed by the writer of the *Elements* and demanded a proof. Ptolemy appears

point of ZH so that ZH lies where HZ is in the figure, while ZK, HK lie along the sides H Γ , ZA respectively: and therefore H Γ , ZA must meet at the point where K falls.

The proof is based on the assumption that two straight lines cannot enclose a space. But Riemann devised a geometry in which this assumption does not hold good, for all straight lines having a common point have another point common also.

αὐτὸ δεικνύναι ἐν τῷ περὶ τοῦ τὰς ἀπ' ἐλαττόνων η δύο δρθων εκβαλλομένας συμπίπτειν, καὶ δείκνυσι πολλά προλαβών των μέχρι τοῦδε τοῦ θεωρήματος ύπο τοῦ Στοιγειωτοῦ προαποδεδειγμένων. ύποκείσθω πάντα είναι άληθη, ίνα μη καὶ ήμεῖς όχλον επεισάγωμεν άλλον, καὶ ώς λημμάτιον τοῦτο δείκνυσθαι διὰ τῶν προειρημένων εν δὲ καὶ τοῦτο των προδεδειγμένων τὸ τὰς ἀπὸ δυεῖν ὀρθαῖς ἴσων έκβαλλομένας μηδαμώς συμπίπτειν. λέγω τοίνυν ότι καὶ τὸ ἀνάπαλιν ἀληθές, καὶ τὸ παραλλήλων οὐσῶν τῶν εὐθειῶν καὶ τεμνομένων ὑπὸ μιᾶς εὐθείας τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας δύο όρθαις ίσας είναι. ἀνάγκη γὰρ τὴν τέμνουσαν τὰς παραλλήλους η δύο ορθαίς ίσας ποιείν τὰς έντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας ἢ δύο ὀρθών ελάσσους ἢ μείζους. ἔστωσαν οὖν παράλληλοι αί ΑΒ, ΓΔ, καὶ ἐμπιπτέτω εἰς αὐτὰς ἡ ΗΖ: λέγω ότι οὐ ποιεί δύο όρθῶν μείζους τὰς ἐντὸς καὶ ἐπὶ τὰ αυτά. εὶ γὰρ αὶ ὑπὸ ΑΖΗ, ΓΗΖ δύο

όρθῶν μείζους, αἱ λοιπαὶ αἱ ὑπὸ ΒΖΗ, ΔΗΖ δύο όρθῶν ἐλάσσους. ἀλλὰ καὶ δύο ὀρθῶν μείζους αἱ αὐταί· οὐδὲν γὰρ μᾶλλον αἱ ΑΖ, ΓΗ παρώλληλοι ἢ ΖΒ, ΗΔ, ὥστε εἰ ἡ ἐμπεσοῦσα εἰς τὰς ΑΖ, ΓΗ δύο ὀρθῶν μείζους ποιεῖ τὰς ἐντός, καὶ 376

to have proved it in his book on the proposition that straight lines drawn from angles less than two right angles meet if produced, and he uses in the proof many of the propositions proved by the writer of the *Elements* before this theorem. Let all these be taken as true, in order that we may not introduce another mass of propositions, and by means of the aforesaid propositions this theorem is proved as a lemma, that straight lines drawn from two angles together equal to two right angles do not meet when produced a—for this is common to both sets of preparatory theorems. I say then that the converse is also true. that if parallel straight lines be cut by one straight line the interior angles on the same side are equal to two right angles.b For the straight line cutting the parallel straight lines must make the interior angles on the same side equal to two right angles or less or greater. Let AB, $\Gamma\Delta$ be parallel straight lines, and let HZ cut them; I say that it does not make the interior angles on the same side greater than two right angles. For if the angles AZH, THZ are greater than two right angles, the remaining angles BZH, Δ HZ are less than two right angles.c But these same angles are greater than two right angles; for AZ, TH are not more parallel than ZB, HA, so that if the straight line falling on AZ, ΓH make the interior angles greater than two right angles, the same straight line falling

^a This is equivalent to Eucl. i. 28.

^b This is equivalent to Eucl. i. 29.

 $^{^{\}circ}$ By Eucl. i. 13, for the angles AZH, BZH are together equal to two right angles and so are the angles Γ HZ, Δ HZ.

ή εἰς τὰς ZB, ΗΔ ἐμπίπτουσα δύο ὀρθῶν ποιήσει μείζους τὰς ἐντός: ἀλλ' αἱ αὐταὶ καὶ δύο ὀρθῶν ἐλάσσους: αἱ γὰρ τέσσαρες αἱ ὑπὸ ΑΖΗ, ΓΗΖ, ΒΖΗ, ΔΗΖ τέτρασιν ὀρθαῖς ἴσαι· ὅπερ ἀδύνατον. ὁμοίως δὴ δείξομεν ὅτι εἰς τὰς παραλλήλους ἐμπίπτουσα οὐ ποιεῖ δύο ὀρθῶν ἐλάσσους τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας. εἰ δὲ μήτε μείζους μήτε ἐλάσσους ποιεῖ τῶν δύο ὀρθῶν, λείπεται τὴν ἐμπίπτουσαν δύο ὀρθαῖς ἴσας ποιεῖν τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη γωνίας.

Τούτου δη οὖν προδεδειγμένου τὸ προκείμενον άναμφισβητήτως άποδείκνυται. λέγω γάρ ὅτι ἐὰν είς δύο εθθείας εθθεία εμπίπτουσα τὰς έντὸς καὶ έπὶ τὰ αὐτὰ μέρη γωνίας δύο ὀρθῶν ἐλάσσονας ποιῆ, συμπεσοῦνται αι εὐθεῖαι ἐκβαλλόμεναι, ἐφ' ἃ μέρη είσιν αι των δύο ορθων ελάσσονες. μη γάρ συμπιπτέτωσαν. ἀλλ' εὶ ἀσύμπτωτοί εἰσιν, ἐφ' ἃ μέρη αι τῶν δύο ὀρθῶν ἐλάσσονες, πολλῷ μᾶλλον έσονται ἀσύμπτωτοι ἐπὶ θάτερα, ἐφ' ἃ τῶν δύο είσιν ορθων αι μείζονες, ωστε εφ' εκάτερα αν είεν ἀσύμπτωτοι αί εὐθεῖαι. εἰ δὲ τοῦτο, παράλληλοί είσιν. άλλὰ δέδεικται ὅτι ἡ εἰς τὰς παραλλήλους έμπίπτουσα τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη δύο όρθαις ισας ποιήσει γωνίας. αι αὐταὶ ἄρα καὶ δύο ορθαίς ίσαι καὶ δύο ορθών ελάσσονες, όπερ άδύνατον.

Ταῦτα προδεδειχώς ὁ Πτολεμαῖος καὶ καταν-

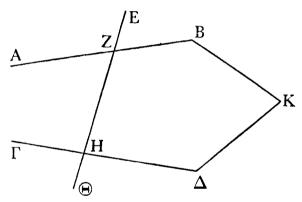

^a See note c on p. 377. ^b The fallacy lies in the assumption that "AZ, ΓH are not more parallel than ZB, HΔ," so that the angles BZH, Δ HZ must also be greater than two right angles. This assump-378

on ZB, $\rm H\Delta$ also makes the interior angles greater than two right angles; but these same angles are less than two right angles, for the four angles AZH, $\rm \Gamma HZ$, BZH, $\rm \Delta HZ$ are equal to four right angles ^a; which is impossible. Similarly we may prove that a straight line falling on parallel straight lines does not make the interior angles on the same side less than two right angles. But if it make them neither greater nor less than two right angles, the only conclusion left is that the transversal makes the interior angles on the same side equal to two right angles.^b

With this preliminary proof, the theorem in question is proved beyond dispute. I mean that if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, the two straight lines, if produced, will meet on that side on which are the angles less than two right angles. For [, if possible, let them not meet. But if they are nonsecant on the side on which are the angles less than two right angles, by much more will they be nonsecant on the other side, on which are the angles greater than two right angles, so that the straight lines would be non-secant on both sides. Now if this should be so, they are parallel. But it has been proved that a straight line falling on parallel straight lines makes the interior angles on the same side equal to two right angles. Therefore the same angles are both equal to and less than two right angles, which is impossible.

Having first proved these things and squarely faced tion is equivalent to the hypothesis that through a given point only one parallel can be drawn to a given straight line; but this hypothesis can be proved equivalent to Euclid's postulate. It is known as "Playfair's Axiom," but is, in fact, stated by Proclus in his note on Eucl. i. 31.

τήσας εἰς τὸ προκείμενον ἀκριβέστερόν τι προσθεῖναι βούλεται καὶ δεῖξαι ὅτι, ἐὰν εἰς δύο εὐθείας εὐθεῖα ἐμπίπτουσα τὰς ἐντὸς καὶ ἐπὶ τὰ αὐτὰ μέρη δύο ὀρθῶν ποιῇ ἐλάσσονας, οὐ μόνον οὐκ εἰσὶν ἀσύμπτωτοι αἱ εὐθεῖαι, ὡς δέδεικται, ἀλλὰ καὶ ἡ σύμπτωσις αὐτῶν κατ' ἐκεῖνα γίνεται τὰ μέρη, ἐφ' ἃ αἱ τῶν δύο ὀρθῶν ἐλάσσονες, οὐκ ἐφ' ἃ αἱ μείζονες. ἔστωσαν γὰρ δύο εὐθεῖαι αἱ ΑΒ, ΓΔ καὶ ἐμπίπτουσα εἰς αὐτὰς ἡ ΕΖΗΘ ποιείτω τὰς ὑπὸ ΑΖΗ καὶ ὑπὸ ΓΗΖ δύο ὀρθῶν ἐλάσσους.

αί λοιπαὶ ἄρα μείζους δύο ὀρθῶν. ὅτι μὲν [οὖν]¹ οὐκ ἀσύμπτωτοι αἱ εὐθεῖαι δέδεικται. εἰ δὲ συμπίπτουσιν, ἢ ἐπὶ τὰ Α, Γ συμπεσοῦνται, ἢ ἐπὶ τὰ Β, Δ. κατὰ τὸ Κ. ἐπεὶ οὖν αἱ μὲν ὑπὸ ΑΖΗ καὶ ΓΗΖ δύο ὀρθῶν εἰσιν ἐλάσσους, αἱ δὲ ὑπὸ ΑΖΗ, ΒΖΗ δύο ὀρθαῖς ἴσαι, κοινῆς ἀφαιρεθείσης τῆς ὑπὸ ΑΖΗ, 380

the theorem in question, Ptolemy tries to make a more precise addition and to prove that, if a straight line falling on two straight lines make the interior angles on the same side less than two right angles, not only are the straight lines not non-secant, as has been proved, but their meeting takes place on that side on which the angles are less than two right angles, and not on the side on which they are greater. For let AB, $\Gamma\Delta$ be two straight lines and let EZH Θ fall on them and make the angles AZH, THZ less than two right angles. Then the remaining angles are greater than two right angles [Eucl. i. 13]. Now it has been proved that the straight lines are not non-secant. If they meet, they will meet either on the side of A, I' or on the side of B, Δ . Let them meet on the side of B, Δ at K. Then since the angles AZH, I'HZ are less than two right angles, while the angles AZH. BZH are equal to two right angles, when the common angle AZH is taken away, the angle IHZ will be less

¹ obv is clearly out of place.

ή ύπὸ ΓΗΖ ἐλάσσων ἔσται τῆς ὑπὸ ΒΖΗ. τριγώνου ἄρα τοῦ ΚΖΗ ἡ ἐκτὸς τῆς ἐντὸς καὶ ἀπεναντίον ἐλάσσων, ὅπερ ἀδύνατον. οὐκ ἄρα κατὰ ταῦτα συμπίπτουσιν. ἀλλὰ μὴν συμπίπτουσι. κατὰ θάτερα ἄρα ἡ σύμπτωσις αὐτῶν ἔσται, καθ' ἃ αἱ τῶν δύο ὀρθῶν εἰσιν ἐλάσσονες.

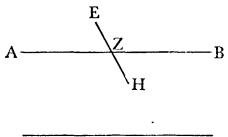

(iv.) Proclus

Ibid., ed. Friedlein 371. 23-373. 2

Τούτου δὴ προυποτεθέντος λέγω ὅτι, ἐὰν παραλλήλων εὐθειῶν τὴν ἐτέραν τέμνει τις εὐθεῖα, τεμεῖ καὶ τὴν λοιπήν.

Έστωσαν γὰρ παράλληλοι αἱ AB, $\Gamma \Delta$, καὶ τεμνέτω τὴν AB ἡ EZH. λέγω ὅτι τὴν $\Gamma \Delta$

τεμεῖ.

Έπει γὰρ δύο εὐθεῖαί εἰσιν ἀφ' ένὸς σημείου τοῦ Ζ, εἰς ἄπειρον ἐκβαλλόμεναι αἰ ΒΖ, ΖΗ, παντὸς μεγέθους μείζονα ἔχουσι διάστασιν, ὥστε καὶ τούτου, ὅσον ἐστὶ τὸ μεταξὺ τῶν παραλλήλων. 382

than the angle BZH. Therefore the exterior angle of the triangle KZH will be less than the interior and opposite angle, which is impossible [Eucl. i. 16]. Therefore they will not meet on this side. But they do meet. Therefore their meeting will be on the other side, on which the angles are less than two right angles.

(iv.) Proclus

Ibid., ed. Friedlein 371. 23-373. 2

This having first been assumed, I say that, if any straight line cut one of parallel straight lines, it will cut the other also.

For let AB, $\Gamma\Delta$ be parallel straight lines, and let EZH cut AB. I say that it will cut $\Gamma\Delta$.

For since BZ, ZH are two straight lines drawn from one point Z, they have, when produced indefinitely, a distance greater than any magnitude, so that it will also be greater than that between the parallels.

όταν οὖν μεῖζον ἀλλήλων διαστῶσιν τῆς τούτων διαστάσεως τεμεῖ ή ΖΗ τὴν ΓΔ. ἐὰν ἄρα παραλλήλων την έτέραν τέμνη τις εὐθεῖα, τεμεῖ καὶ την

λοιπήν.

Τούτου προαποδείχθεντος ἀκολούθως δείξομεν τὸ προκείμενον. ἔστωσαν γὰρ δύο εὐθεῖαι αί ΑΒ, ΓΔ, καὶ ἐμπιπτέτω εἰς αὐτὰς ἡ ΕΖ ἐλάσσονας δύο ὀρθών ποιοῦσα τὰς ὑπὸ ΒΕΖ, ΔΖΕ.1 λέγω ότι συμπεσούνται αί εὐθεῖαι κατὰ ταῦτα τὰ μέρη, ἐφ' ἃ αί τῶν δύο ὀρθῶν εἰσιν ἐλάσσους.

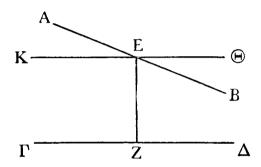

Έπειδή γὰρ αἱ ὑπὸ ΒΕΖ, ΔΖΕ ἐλάσσους εἰσὶ δύο ὀρθῶν, τῆ ὑπεροχῆ τῶν δύο ὀρθῶν ἔστω ἴση ή ύπὸ ΘΕΒ. καὶ ἐκβεβλήσθω ἡ ΘΕ ἐπὶ τὸ Κ. έπεὶ οὖν εἰς τὰς ΚΘ, ΓΔ ἐμπέπτωκεν ἡ ΕΖ καὶ ποιεί τὰς ἐντὸς δύο ὀρθαίς ἴσας τὰς ὑπὸ ΘΕΖ, ΔΖΕ, παράλληλοί είσιν αί ΘΚ, ΓΔ εὐθεῖαι. καὶ τέμνει τὴν ΚΘ ἡ ΑΒ· τεμεῖ ἄρα καὶ τὴν ΓΔ διὰ τὸ προδεδειγμένον. συμπεσοῦνται άρα αἱ ΑΒ, ΓΔ κατὰ τὰ μέρη ἐκεῖνα, ἐφ' ἃ αἱ τῶν δύο ὀρθῶν έλάσσονες, ώστε δέδεικται το προκείμενον.

¹ ΔEZ codd., corresi.

a The method is ingenious, but Clavius detected the flaw. which lies in the initial assumption, taken from Aristotle, that two divergent straight lines will eventually be so far apart that a perpendicular drawn from a point on one to the other will be greater than any assigned distance; Clavius draws attention to the conchoid of Nuomedes (v. vol. i. pp. 298-301), which continually approaches its asymptote, and therefore continually gets farther away from the tangent at the vertex; but the perpendicular from any point on the curve to that tangent will always be less than the distance between the tangent and the asymptote.

Whenever, therefore, they are at a distance from one another greater than the distance between the parallels, ZH will cut $\Gamma\Delta$. If, therefore, any straight line cuts one of parallels, it will cut the other also.

This having first been established, we shall prove in turn the theorem in question. For let AB, $\Gamma\Delta$ be two straight lines, and let EZ fall on them so as to

make the angles BEZ, Δ ZE less than two right angles. I say that the straight lines will meet on that side on which are the angles less than two right angles.

For since the angles BEZ, Δ ZE are less than two right angles, let the angle Θ EB be equal to the excess of the two right angles. And let Θ E be produced to K. Then since EZ falls on K Θ , $\Gamma\Delta$ and makes the interior angles Θ EZ, Δ ZE equal to two right angles, the straight lines Θ K, $\Gamma\Delta$ are parallel. And AB cuts K Θ ; therefore, by what was before shown, it will also cut $\Gamma\Delta$. Therefore AB, $\Gamma\Delta$ will meet on that side on which are the angles less than two right angles, so that the theorem in question is proved.

^a Θ Z is not, in fact, joined in the Ms. figures.

b This is proved in a lemma immediately following the proposition by drawing an arc of a circle with Θ as centre 388

I mean equilateral and equiangular figures—the greatest is that which has most angles.

For let ABF, Δ EZ be equilateral and equiangular figures having equal perimeters, and let ABF have the more angles. I say that ABF is the greater.

For let H, θ be the centres of the circles circumscribed about the polygons AB Γ , Δ EZ, and let HB, $H\Gamma$, ΘE , ΘZ^a be joined. And from H, Θ let HK, $\Theta \Lambda$ be drawn perpendicular to B Γ , EZ. Then since AB Γ has more angles than ΔEZ , BF is contained more often in the perimeter of ABT than EZ is contained in the perimeter of ΔEZ . And the perimeters are equal. Therefore EZ>B Γ ; and therefore E Λ >BK. Let ΛM be placed equal to BK, and let ΘM be joined. Then since the straight line EZ bears to the perimeter of the polygon ΔEZ the same ratio as the angle EOZ bears to four right angles—owing to the fact that the polygon is equilateral and the sides cut off equal arcs from the circumscribing circle, while the angles at the centre are in the same ratio as the arcs on which they stand [Eucl. iii. 26]-and the perimeter of ΔEZ , that is the perimeter of ABT, bears to B Γ the same ratio as four right angles bears to the angle BHΓ, therefore ex aequali [Eucl. v. 17]

 $EZ : B\Gamma = angle E\Theta Z : angle BH\Gamma$,

i.e., $E\Lambda : \Lambda M = \text{angle } E\Theta Z : \text{angle } BH\Gamma$,

i.e., E Λ : Λ M = angle E Θ Λ : angle BHK.

And since $E\Lambda : \Lambda M > \text{angle } E\Theta\Lambda : \text{angle } M\Theta\Lambda$, as we shall prove in due course,

and ΘM as radius cutting ΘE and $\Theta \Lambda$ produced, as in Eucl. Optic. 8 (v. vol. i. pp. 502-505); the proposition is equivalent to the formula $\tan \alpha : \tan \beta > \alpha : \beta$ if $\frac{1}{2}\pi > \alpha > \beta$.

πρὸς ΛΜ ἡ ὑπὸ ΕΘΛ πρὸς τὴν ὑπὸ ΒΗΚ, ἡ ὑπὸ ΕΘΛ πρὸς τὴν ὑπὸ ΒΗΚ μείζονα λόγον ἔχει ἤπερ πρὸς τὴν ὑπὸ ΜΘΛ. μείζων ἄρα ἡ ὑπὸ ΜΘΛ γωνία τῆς ὑπὸ ΒΗΚ. ἔστιν δὲ καὶ ὀρθὴ ἡ πρὸς τῷ Λ ὀρθῆ τῆ πρὸς τῷ Κ ἴση. λοιπὴ ἄρα ἡ ὑπὸ ΗΒΚ μείζων ἔσται τῆς ὑπὸ ΘΜΛ. κείσθω τῆ ὑπὸ ΗΒΚ ἴση ἡ ὑπὸ ΛΜΝ καὶ διήχθω ἡ ΛΘ ἐπὶ τὸ Ν. καὶ ἐπεὶ ἴση ἐστὶν ἡ ὑπὸ ΗΒΚ τῆ ὑπὸ ΝΜΛ, ἀλλὰ καὶ ἡ πρὸς τῷ Λ ἴση τῆ πρὸς τῷ Κ, ἔστι δὲ καὶ ἡ ΒΚ πλευρᾶ τῆ ΜΛ ἴση, ἴση ἄρα καὶ ἡ ΗΚ τῆς ΝΛ. μείζων ἄρα ἡ ΗΚ τῆς ΘΛ. μεῖζον ἄρα καὶ τὸ ὑπὸ τῆς ΑΒΓ περιμέτρου καὶ τῆς ΗΚ τοῦ ὑπὸ τῆς ΔΕΖ περιμέτρου καὶ τῆς ΗΚ διπλάσιον τοῦ ΑΒΓ πολυγώνου, ἐπεὶ καὶ τὸ ὑπὸ τῆς ΒΓ καὶ τῆς ΗΚ διπλάσιον τοῦ ΑΒΓ πολυγώνου. μεῖζον ἄρα τὸ ΑΒΓ πολύγωνον τοῦ ΔΕΖ περιμέτρου καὶ τῆς ΘΛ διπλάσιον τοῦ ΔΕΖ πολυγώνου. μεῖζον ἄρα τὸ ΑΒΓ πολύγωνον τοῦ ΔΕΖ.

Ibid. 358. 12-360. 3

Τούτου δεδειγμένου λέγω, ὅτι ἐὰν κύκλος εὐθυγράμμω ἰσοπλεύρω τε καὶ ἰσογωνίω ἰσοπερίμετρος ἢ, μείζων ἔσται ὁ κύκλος.

Κύκλος γὰρ ὁ ΑΒΓ ἰσοπλεύρω τε καὶ ἰσογωνίω τῷ ΔΕΖ εὐθυγράμμω ἰσοπερίμετρος ἔστω λέγω,

ότι μείζων ἐστίν ὁ κύκλος.

Εἰλήφθω τοῦ μὲν ΑΒΓ κύκλου κέντρον τὸ Η, τοῦ δὲ περὶ τὸ ΔΕΖ πολύγωνον περιγραφομένου τὸ Θ, καὶ περιγεγράφθω περὶ τὸν ΑΒΓ κύκλον 390

and $E\Lambda : \Lambda M = angle E\Theta\Lambda : angle BHK$,

 \therefore angle E $\Theta\Lambda$: angle BHK> angle E $\Theta\Lambda$: M $\Theta\Lambda$.

∴ angle MθΛ> angle BHK.

Now the right angle at Λ is equal to the right angle at K. Therefore the remaining angle HBK is greater than the angle $\Theta M\Lambda$ [by Eucl. i. 32]. Let the angle ΛMN be placed equal to the angle HBK, and let $\Lambda \Theta$ be produced to N. Then since the angle HBK is equal to the angle NMA, and the angle at Λ is equal to the angle at K, while BK is equal to the side $\hat{M}\Lambda$. therefore HK is equal to NA [Eucl. i. 26]. Therefore HK> $\Theta\Lambda$. Therefore the rectangle contained by the perimeter of ABT and HK is greater than the rectangle contained by the perimeter of ΔEZ and $\Theta \Lambda$. But the rectangle contained by the perimeter of ABT and HK is double of the polygon ABT, since the rectangle contained by BF and HK is double of the triangle HBI [Eucl. i. 41]; and the rectangle contained by the perimeter of ΔEZ and $\Theta\Lambda$ is double of the polygon ΔEZ . Therefore the polygon AB Γ is greater than ΔEZ .

Ibid. 358, 12-360, 3

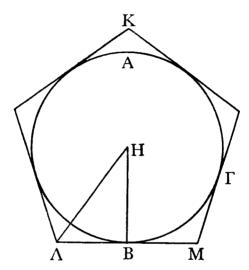

This having been proved, I say that if a circle have an equal perimeter with an equilateral and equiangular rectilineal figure, the circle shall be the greater.

For let ABT be a circle having an equal perimeter with the equilateral and equiangular rectilineal figure

 ΔEZ . I say that the circle is the greater.

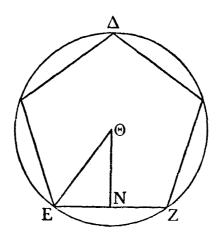

Let H be the centre of the circle $AB\Gamma$, Θ the centre of the circle circumscribing the polygon ΔEZ ; and let there be circumscribed about the circle $AB\Gamma$ the

πολύγωνον ὅμοιον τῷ ΔΕΖ τὸ ΚΛΜ, καὶ ἐπεζεύχθω ἡ HB, καὶ κάθετος ἀπὸ τοῦ Θ ἐπὶ τὴν ΕΖ ἤχθω ἡ ΘΝ, καὶ ἐπεζεύχθωσαν αἱ ΗΛ, ΘΕ.

ἐπεὶ οὖν ἡ τοῦ ΚΛΜ πολυγώνου περίμετρος μείζων ἐστὶν τῆς τοῦ ΑΒΓ κύκλου περιμέτρου ὡς ἐν τῷ Περὶ σφαίρας καὶ κυλίνδρου ᾿Αρχιμήδης, ἴση δὲ ἡ τοῦ ΑΒΓ κύκλου περίμετρος τῆ τοῦ ΔΕΖ πολυγώνου περιμέτρω, μείζων ἄρα καὶ ἡ τοῦ ΚΛΜ πολυγώνου περίμετρος τῆς τοῦ ΔΕΖ πολυγώνου περιμέτρου. καὶ εἰσιν ὅμοια τὰ πολύγωνα· μείζων ἄρα ἡ ΒΛ τῆς ΝΕ. καὶ ὅμοιον τὸ ΗΛΒ τρίγωνον τῷ ΘΕΝ τριγώνω, ἐπεὶ καὶ τὰ 392

polygon KAM similar to ΔEZ , and let HB be joined, and from Θ let ΘN be drawn perpendicular to EZ, and let $H\Lambda$, ΘE be joined. Then since the perimeter

of the polygon KAM is greater than the perimeter of the circle AB Γ , as Archimedes proves in his work On the Sphere and Cylinder,^a while the perimeter of the circle AB Γ is equal to the perimeter of the polygon ΔEZ , therefore the perimeter of the polygon KAM is greater than the perimeter of the polygon ΔEZ . And the polygons are similar; therefore B Λ > NE. And the triangle H Λ B is similar to the triangle Θ EN,

^a Prop. 1, v. supra, pp. 48-49.

ὅλα πολύγωνα. μείζων ἄρα καὶ ἡ HB τῆς ΘΝ. καὶ ἔστιν ἴση ἡ τοῦ ABΓ κύκλου περίμετρος τῆ τοῦ ΔΕΖ πολυγώνου περιμέτρω. τὸ ἄρα ὑπὸ τῆς περιμέτρου τοῦ ΑΒΓ κύκλου καὶ τῆς ΗΒ μεῖζόν έστιν τοῦ ὑπὸ τῆς περιμέτρου τοῦ ΔΕΖ πολυγώνου καὶ τῆς ΘΝ. ἀλλὰ τὸ μὲν ὑπὸ τῆς περιμέτρου τοῦ ΑΒΓ κύκλου καὶ τῆς ΗΒ διπλάσιον τοῦ ΑΒΓ κύκλου 'Αρχιμήδης ἔδειξεν, οδ καὶ τὴν δεῖξιν έξῆς ἐκθησόμεθα· τὸ δὲ ὑπὸ τῆς περιμέτρου τοῦ ΔΕΖ πολυγώνου καὶ τῆς ΘΝ διπλάσιον τοῦ ΔΕΖ πολυγώνου. μείζων ἄρα ὁ ΑΒΓ κύκλος τοῦ ΔΕΖ πολυγώνου, ὅπερ ἔδει δείξαι.

Ibid. 364, 12-14

Λέγω δή καὶ ὅτι τῶν ἰσοπεριμέτρων εὐθυγράμμων σχημάτων καὶ τὰς πλευρὰς ἰσοπληθεῖς έγόντων τὸ μέγιστον ἰσόπλευρόν τέ έστιν καὶ ισονώνιον.

Ibid. 374, 12-14

Λέγω δη ότι καὶ ή σφαῖρα μείζων ἐστὶν πάντων των ίσην ἐπιφάνειαν ἐχόντων στερεων σχημάτων, προσχρησάμενος τοις ύπο Αρχιμήδους δεδειγμένοις έν τῶ Περὶ σφαίρας καὶ κυλίνδρου.

(d) Division of Zodiac Circle into 360 Parts: Hypsicles

Hypsicl. Anaph., ed. Manitius 5. 25-31 Τοῦ τῶν Ζωδίων κύκλου εἰς τξ περιφερείας ἴσας

^a Dim. Circ. Prop. 1, v. vol. i. pp. 316-321.

b The proofs of these two last propositions are worked out by similar methods.

since the whole polygons are similar; therefore HB> Θ N. And the perimeter of the circle AB Γ is equal to the perimeter of the polygon Δ EZ. Therefore the rectangle contained by the perimeter of the circle AB Γ and HB is greater than the rectangle contained by the perimeter of the polygon Δ EZ and Θ N. But the rectangle contained by the perimeter of the circle AB Γ and HB is double of the circle AB Γ as was proved by Archimedes, whose proof we shall set out next; and the rectangle contained by the perimeter of the polygon Δ EZ and Θ N is double of the polygon Δ EZ [by Eucl. i. 41]. Therefore the circle AB Γ is greater than the polygon Δ EZ, which was to be proved.

Ibid. 364. 12-14

Now I say that, of all rectilineal figures having an equal number of sides and equal perimeter, the greatest is that which is equilateral and equiangular.

Ibid. 374. 12-14

Now I say that, of all solid figures having an equal surface, the sphere is the greatest; and I shall use the theorems proved by Archimedes in his work On the Sphere and Cylinder.

(d) Division of Zodiac Circle into 360 Parts:

^a Hypsicles, who flourished in the second half of the second century B.C., is the author of the continuation of Euclid's *Elements* known as Book xiv. Diophantus attributed to him a definition of a polygonal number which is equivalent to the formula $\frac{1}{2}$ $n\{2 + (n-1)(a-2)\}$ for the nth a-gonal number.

The passage here cited is the earliest known reference in Greek to the division of the ecliptic into 360 degrees. This number appears to have been adopted by the Greeks from the Chaldaeans, among whom the zodiac was divided into twelve signs and each sign into thirty parts according to one system, sixty according to another (v. Tannery, Mémoires scientifiques, ii. pp. 256-268). The Chaldaeans do not, however, seem to have applied this system to other circles; Hipparchus is believed to have been the first to divide the 396

divided into 360 equal arcs, let each of the arcs be called a *degree in space*, and similarly, if the time in which the zodiac circle returns to any position it has left be divided into 360 equal times, let each of the times be called a *degree in time*.^a

(e) HANDBOOKS

(i.) Cleomedes b

Cleomedes, On the Circular Motion of the Heavenly Bodies ii. 6, ed. Ziegler 218. 8-224. 8

Although these facts have been proved with regard to the eclipse of the moon, the argument that the moon suffers eclipse by falling into the shadow of the earth seems to be refuted by the stories told about paradoxical eclipses. For some say that an eclipse of the moon may take place even when both luminaries are seen above the horizon. This should make it clear that the moon does not suffer eclipse by

circle in general into 360 degrees. The problem which Hypsicles sets himself in his book is: Given the ratio between the length of the longest day and the length of the shortest day at any given place, to find how many time-degrees it takes any given sign to rise. A number of arithmetical lemmas are proved.

b Cleomedes is known only as the author of the two books Κυκλική θεωρία μετεώρων. This work is almost wholly based on Posidonius. He must therefore have lived after Posidonius and presumably before Ptolemy, as he appears to know nothing of Ptolemy's works. In default of better evidence, he is generally assigned to the middle of the first century B.C.

The passage explaining the measurement of the earth by Eratosthenes has already been cited (supra, pp. 266-273).

This is the only other passage calling for notice.

της γης περιπίπτουσα, άλλ' έτερον τρόπον. παλαιότεροι τῶν μαθηματικῶν οὕτως ἐπεχείρουν λύειν την ἀπορίαν ταύτην. ἔφασαν γάρ, ὅτι . . . οί δ' ἐπὶ γῆς ἐστῶτες οὐδὲν ἂν κωλύοιντο ὁρᾶν άμφοτέρους αὐτοὺς ἐπὶ τοῖς κυρτώμασι τῆς γῆς έστωτες. . . τοιαύτην μεν οὖν οἱ παλαιότεροι τῶν μαθηματικῶν τὴν τῆς προσαγομένης ἀπορίας λύσιν ἐποιήσαντο. μή ποτε δ' οὐχ ὑγιῶς εἰσιν ἐνηνεγμένοι. ἐφ' ὕψους μὲν γὰρ ἡ ὄψις ἡμῶν γενομένη δύναιτ' αν τοῦτο παθείν, κωνοειδοῦς τοῦ ορίζοντος γινομένου πολύ ἀπὸ τῆς γῆς ἐκ τὸν ἀέρα ήμῶν ἐξαρθέντων, ἐπὶ δὲ τῆς γῆς ἐστώτων οὐδαμῶς. εἰ γὰρ καὶ κύρτωμά ἐστιν, ἐφ' οὖ βεβήκαμεν, ἀφανίζεται ἡμῶν ἡ ὄψις ὑπὸ τοῦ μεγέθους τῆς γῆς. . . . ἀλλὰ πρῶτον μὲν ἀπ-αντητέον λέγοντας, ὅτι πέπλασται ὁ λόγος οῦτος ύπό τινων ἀπορίαν βουλομένων ἐμποιῆσαι τοῖs περί ταθτα καταγινομένοις των ἀστρολόγων καί φιλοσόφων. . . . πολλών δὲ καὶ παντοδαπών περὶ τον ἀέρα παθῶν συνίστασθαι πεφυκότων οὐκ αν είη αδύνατον, ήδη καταδεδυκότος τοῦ ήλίου καὶ ύπὸ τὸν ὁρίζοντα ὅντος φαντασίαν ἡμῖν προσπεσεῖν ώς μηδέπω καταδεδυκότος αὐτοῦ, ἢ νέφους παχυτέρου πρὸς τῆ δύσει ὄντος καὶ λαμπρυνομένου ύπο των ήλιακων ακτίνων καὶ ήλίου ήμιν φαντασίαν άποπέμποντος η άνθηλίου γενομένου. καὶ γὰο

^a i.e., the horizon would form the base of a cone whose vertex would be at the eye of the observer. He could thus look down on both the sun and moon as along the generators of a cone, even though they were diametrically opposite each other.

falling into the shadow of the earth, but in some other way. . . . The more ancient of the mathematicians tried to explain this difficulty after this fashion. They said that persons standing on the earth would not be prevented from seeing them both because they would be standing on the convexities of the earth. . . . Such is the solution of the alleged difficulty given by the more ancient of the mathematicians. But its soundness may be doubted. For, if our eye were situated on a height, the phenomenon in question might take place, the horizon becoming conical a if we were raised sufficiently far above the earth, but it could in no wise happen if we stood on the earth. For though there might be some convexity where we stood, our sight itself becomes evanescent owing to the size of the earth. . . . The fundamental objection must first be made, that this story has been invented by certain persons wishing to make difficulty for the astronomers and philosophers who busy themselves with such matters. . . . Nevertheless, as the conditions which naturally arise in the air are many and various, it would not be impossible that, when the sun has just set and is below the horizon, we should receive the impression of its not having yet set, if there were a cloud of considerable density at the place of setting and if it were illumined by the solar rays and transmitted to us an image of the sun, or if there were a mock sun. b For such images are often

b Lit. "anthelion," defined in the Oxford English Dictionary as "a luminous ring or nimbus seen (chiefly in alpine or polar regions) surrounding the shadow of the observer's head projected on a cloud or fog bank opposite the sun." The explanation here tentatively put forward by Cleomedes is, of course, the true one.

τοιαῦτα πολλὰ φαντάζεται ἐν τῷ ἀέρι, καὶ μάλιστα περὶ τὸν Πόντον.

seen in the air, and especially in the neighbourhood of Pontus.

(ii.) Theon of Smyrna

Ptolemy, Syntaxis x. 1, ed. Heiberg i. pars ii. 296. 14-16

For in the account given to us by Theon the mathematician we find recorded an observation made in the sixteenth year of Hadrian.^a

Theon of Smyrna, ed. Hiller 1. 1-2. 2

Everyone would agree that he could not understand the mathematical arguments used by Plato unless he were practised in this science; and that the study of these matters is neither unintelligent nor unprofitable in other respects Plato himself would seem to make plain in many ways. One who had become skilled in all geometry and all music and astronomy would be reckoned most happy on making acquaintance with the writings of Plato, but this cannot be come by easily or readily, for it calls for a very great deal of application from youth upwards. In order that those who have failed to become practised in these studies, but aim at a knowledge of his writings, should not wholly fail in their desires, I shall make a summary and concise sketch of the mathematical theorems which are specially necessary for readers of Plato, covering not only arithmetic and music and geometry, but also their application to stereometry and astronomy, for

VOL. II 2 D 401

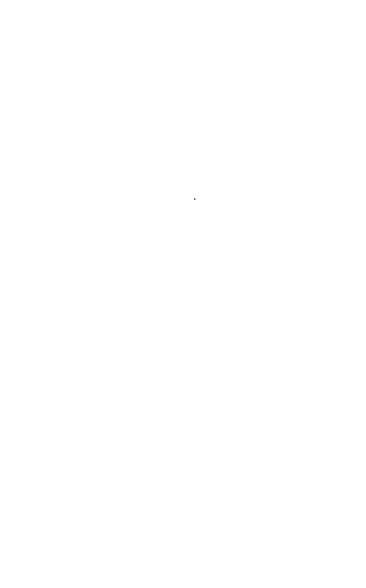

^a i.e., in A.D. 132. Ptolemy mentions other observations made by Theon in the years A.D. 127, 129, and 130. In three places Theon of Alexandria refers to his namesake as "the old Theon," $\delta \Theta \epsilon \omega \nu \pi a \lambda a \iota \delta s$ (ed. Basil. pp. 390, 395, 396).

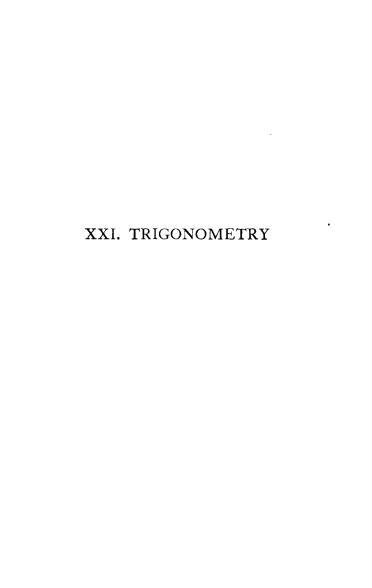

οδόν τε είναι φησι τυχεῖν τοῦ ἀρίστου βίου, διὰ πολλών πάνυ δηλώσας ώς οὐ χρὴ τῶν μαθημάτων ἀμελεῖν.

^a By way of example, Theon proceeds to relate Plato's reply to the craftsmen about the doubling of the cube (v.

without these studies, as he says, it is not possible to attain the best life, and in many ways he makes clear that mathematics should not be ignored.^a

vol. i. p. 257), and also the *Epinomis*. Theon's work, which has often been cited in these volumes, is a curious hotch-potch, containing little of real value to the study of Plato and no original work.

^a The beginnings of Greek trigonometry may be found in the science of *sphaeric*, the geometry of the sphere, for which v. vol. i. p. 5 n. b. It reached its culminating point in the *Sphaerica* of Theodosius.

Trigonometry in the strict sense was founded, so far as we know, by Hipparchus, the great astronomer, who was born at Nicaea in Bithynia and is recorded by Ptolemy to have made observations between 161 and 126 B.c., the most important of them at Rhodes. His greatest achievement was the discovery of the precession of the equinoxes, and he made a calculation of the mean lunar month which differs by less than a second from the present accepted figure. Unfortunately the only work of his which has survived is his early Commentary on the Phenomena of Eudoxus and Aratus. It

An investigation of the chords in a circle is made by Hipparchus in twelve books and again by Menelaus in six.^a

Heron, Metrics i. 22, ed. H. Schöne (Heron iii.) 58, 13-20

Let $AB\Gamma\Delta EZH\Theta K$ be an equilateral and equiangular enneagon,^b whose sides are each equal to 10. To find its area. Let there be described about it a circle with centre Λ , and let $E\Lambda$ be joined and pro-

is clear, however, from the passage here cited, that he drew up, as did Ptolemy, a table of chords, or, as we should say, a table of sines; and Heron may have used this table (v) the

next passage cited and the accompanying note).

Menelaus, who also drew up a table of chords, is recorded by Ptolemy to have made an observation in the first year of Trajan's reign (a.o. 98). He has already been encountered (vol. i. pp. 348-349 and n. c) as the discoverer of a curve called "paradoxical." His trigonometrical work Sphaerica has fortunately been preserved, but only in Arabic, which will prevent citation here. A proof of the famous theorem in spherical trigonometry bearing his name can, however, be given in the Greek of Ptolemy (infra, pp. 458-463); and a summary from the Arabic is provided by Heath, H.G.M. ii. 262-273.

b i.e., a figure of nine sides.

ζεύχθω ή ΕΛ καὶ ἐκβεβλήσθω ἐπὶ τὸ Μ, καὶ ἐπεζεύχθω ή ΜΖ. τὸ ἄρα ΕΖΜ τρίγωνον δοθέν ἐστιν τοῦ ἐνναγώνου. δέδεικται δὲ ἐν τοῖς περὶ τῶν ἐν κύκλῳ εὐθειῶν, ὅτι ἡ ΖΕ τῆς ΕΜ τρίτον μέρος ἐστὶν ὡς ἔγγιστα.

2. PTOLEMY

(a) GENERAL

Suidas, s.v. Πτολεμαΐος

Πτολεμαΐος, ὁ Κλαύδιος χρηματίσας, ᾿Αλεξανδρεύς, φιλόσοφος, γεγονὼς ἐπὶ τῶν χρόνων Μάρκου τοῦ βασιλέως. οὖτος ἔγραψε Μηχανικὰ βιβλία ȳ, Περὶ φάσεων καὶ ἐπισημασιῶν ἀστέρων ἀπλανῶν βιβλία β, Ἅπλωσιν ἐπιφανείας σφαίρας, Κανόνα πρόχειρον, τὸν Μέγαν ἀστρονόμον ἤτοι Σύνταξιν· καὶ ἄλλα.

Nothing else is certainly known of the life of Ptolemy except, as can be gleaned from his own works, that he made observations between A.D. 125 and 141 (or perhaps 151). Arabian traditions add details on which too much reliance should not be placed. Suidas's statement that he was born

408

a Λ similar passage (i. 24, ed. H. Schöne 62. 11-20) asserts that the ratio of the side of a regular hendecagon to the diameter of the circumscribing circle is approximately $\frac{7}{25}$; and of this assertion also it is said δέδεικται δὲ ἐν τοῖς περί τῶν ἐν κύκλῳ εὐθειῶν. These are presumably the works of Hipparchus and Menelaus, though this opinion is controverted by Λ . Rome, "Premiers essais de trigonométric rectiligne chez les Grees" in L'Antiquit'e classique, t. 2 (1933), pp. 177-192. The assertions are equivalent to saying that sin 20° is approximately 0.333... and sin 16° 21′ 49″ is approximately 0.28.

duced to M, and let MZ be joined. Then the triangle EZM is given in the enneagon. But it has been proved in the works on chords in a circle that ZE: EM is approximately $\frac{1}{3}$.

2. PTOLEMY

(a) GENERAL

Suidas, s.v. Ptolemaeus

Ptolemy, called Claudius, an Alexandrian, a philosopher, born in the time of the Emperor Marcus. He wrote Mechanics, three books, On the Phases and Seasons of the Fixed Stars, two books, Explanation of the Surface of a Sphere, A Ready Reckoner, the Great Astronomy or Syntaxis; and others.

in the time of the Emperor Marcus [Aurelius] is not accurate as Marcus reigned from A.D. 161 to 180.

Ptolemy's Mechanics has not survived in any form; but the books On Balancings and On the Elements mentioned by Simplicius may have been contained in it. The lesser astronomical works of Ptolemy published in the second volume of Heiberg's edition of Ptolemy include, in Greek, Φάσεις άπλανων αστέρων και συναγωγή έπισημασιών and Προχείρων κανόνων διάταξις καὶ ψηφοφορία, which can be identified with two titles in Suidas's notice. In the same edition is the Planisphaerium, a Latin translation from the Arabic, which can be identified with the "Απλωσις ἐπιφανείας σφαίρας of Suidas; it is an explanation of the stereographic system of projection by which points on the heavenly sphere are represented on the equatorial plane by projection from a polecircles are projected into circles, as Ptolemy notes, except great circles through the poles, which are projected into straight lines.

Allied to this, but not mentioned by Suidas, is Ptolemy's Analemma, which explains how points on the heavenly sphere can be represented as points on a plane by means of orthogonal projection upon three planes mutually at right angles—

Simpl. in De caelo iv. 4 (Aristot. 311 b 1), ed. Heiberg 710. 14-19

Πτολεμαΐος δὲ ὁ μαθηματικὸς ἐν τῷ Περὶ ῥοπῶν τὴν ἐναντίαν ἔχων τῷ ᾿Αριστοτέλει δόξαν πειρᾶται κατασκευάζειν καὶ αὐτός, ὅτι ἐν τῇ ἑαυτῶν χώρᾳ οὕτε τὸ ὕδωρ οὔτε ὁ ἀὴρ ἔχει βάρος. καὶ ὅτι μὲν τὸ ὕδωρ οὐκ ἔχει, δείκνυσιν ἐκ τοῦ τοὺς καταδύοντας μὴ αἰσθάνεσθαι βάρους τοῦ ἐπικειμένου ὕδατος, καίτοι τινὰς εἰς πολὺ καταδύοντας βάθος.

Ibid. i. 2, 269 a 9, ed. Heiberg 20. 11

Πτολεμαΐος ἐν τῷ Περὶ τῶν στοιχείων βιβλίφ καὶ ἐν τοῖς 'Οπτικοῖς . . .

Ibid. i. 1, 268 a 6, ed. Heiberg 9. 21-27

'Ο δὲ θαυμαστὸς Πτολεμαῖος ἐν τῷ Περὶ διαστάσεως μονοβίβλω ἀπέδειξεν, ὅτι οὐκ εἰσὶ

the meridian, the horizontal and the "prime vertical." Only fragments of the Greek and a Latin version from the Arabic have survived; they are given in Heiberg's second volume.

Among the "other works" mentioned by Suidas are presumably the *Inscription in Canobus* (a record of some of Ptolemy's discoveries), which exists in Greek; the ' $Tm0\theta \epsilon \sigma \omega \tau \Delta \nu \omega \omega = 0$ which the first book is extant in Greek and the second in Arabic; and the *Optics* and the book *On Dimension* mentioned by Simplicius.

But Ptolemy's fame rests most securely on his Great Astronomy or Syntaxis as it is called by Suidas. Ptolemy himself called this majestic astronomical work in thirteen books the Μαθηματική σύνταξις or Mathematical Collection. In due course the lesser astronomical works came to be called the Μικρὸς ἀστρονομούμενος (τόπος), the Little Astronomy, and the Syntaxis came to be called the Μεγάλη σύνταξις, or Great Collection. Later still the Arabs, combining their article Al

Simplicius, Commentary on Aristotle's De caelo iv. 4 (311 b 1), ed. Heiberg 710. 14-19

Ptolemy the mathematician in his work On Balancings maintains an opinion contrary to that of Aristotle and tries to show that in its own place neither water nor air has weight. And he proves that water has not weight from the fact that divers do not feel the weight of the water above them, even though some of them dive into considerable depths.

Ptolemy in his book On the Elements and in his Optics . . $.^a$

Ibid. i. 1, 268 a 6, ed. Heiberg 9. 21-27

The gifted Ptolemy in his book On Dimension showed that there are not more than three dimen-

with the Greek superlative $\mu \epsilon \gamma \nu \sigma \tau \sigma s$, called it Al-majisti; corrupted into *Almagest*, this has since been the favourite name for the work.

The Syntaxis was the subject of commentaries by Pappus and Theon of Alexandria. The trigonometry in it appears to have been abstracted from earlier treatises, but condensed and arranged more systematically.

Ptolemy's attempt to prove the parallel-postulate has

already been noticed (supra, pp. 372-383).

a Ptolemy's Optics exists in an Arabic version, which was translated into Latin in the twelfth century by Admiral Eugenius Siculus (v. G. Govi, L' ottica di Claudio Tolomeo di Eugenio Ammiraglio di Sicilia); but of the five books the first and the end of the last are missing. Until the Arabic text was discovered, Ptolemy's Optics was commonly supposed to be identical with the Latin work known as De Speculis; but this is now thought to be a translation of Heron's Catoptrica by William of Moerbeke (v. infra, p. 502 n. a).

πλείονες τῶν τριῶν διαστάσεις, ἐκ τοῦ δεῖν μὲν τὰς διαστάσεις ὡρισμένας εἶναι, τὰς δὲ ὡρισμένας διαστάσεις κατ' εὐθείας λαμβάνεσθαι καθέτους, τρεῖς δὲ μόνας πρὸς ὀρθὰς ἀλλήλαις εὐθείας δυνατὸν εἶναι λαβεῖν, δύο μὲν καθ' ἃς τὸ ἐπίπεδον ὁρίζεται, τρίτην δὲ τὴν τὸ βάθος μετροῦσαν. ὥστε, εἴ τις εἴη μετὰ τὴν τριχῆ διάστασιν ἄλλη, ἄμετρος ἂν εἴη παντελῶς καὶ ἀόριστος.

(b) TABLE OF SINES

(i.) Introduction

Ptol. Math. Syn. i. 10, ed. Heiberg i. pars i. 31. 7-32. 9

ι΄. Περὶ τῆς πηλικότητος τῶν ἐν τῷ κύκλῳ εὐθειῶν

Πρὸς μὲν οὖν τὴν ἐξ ἐτοίμου χρῆσιν κανονικήν τινα μετὰ ταῦτα ἔκθεσιν ποιησόμεθα τῆς πηλικότητος αὐτῶν τὴν μὲν περίμετρον εἰς τξ τμήματα διελόντες, παρατιθέντες δὲ τὰς ὑπὸ τὰς καθ' ἡμιμοίριον παραυξήσεις τῶν περιφερειῶν ὑποτεινομένας εὐθείας, τουτέστι πόσων εἰσὶν τμημάτων ὡς τῆς διαμέτρου διὰ τὸ ἐξ αὐτῶν τῶν ἐπιλογισμῶν φανησόμενον ἐν τοῖς ἀριθμοῖς εὔχρηστον εἰς ρκ τμήματα διῃρημένης. πρότερον δὲ δείξομεν, πῶς ἄν ὡς ἔνι μάλιστα δι' ὀλίγων καὶ τῶν αὐτῶν θεωρημάτων εὐμεθόδευτον καὶ ταχεῖαν τὴν ἐπιβολὴν τὴν πρὸς τὰς πηλικότητας αὐτῶν ποιοίμεθα, ὅπως μὴ μόνον ἐκτεθειμένα τὰ μεγέθη τῶν εὐθειῶν ἔχωμεν ἀνεπιστάτως, ἀλλὰ καὶ διὰ τῆς ἐκ τῶν γραμμῶν μεθοδικῆς αὐτῶν συστάσεως τὸν ἔλεγχον ἐξ εὐχεροῦς μεταχειριζώμεθα. καθόλου 412

sions; for dimensions must be determinate, and determinate dimensions are along perpendicular straight lines, and it is not possible to find more than three straight lines at right angles one to another, two of them determining a plane and the third measuring depth; therefore, if any other were added after the third dimension, it would be completely unmeasurable and undetermined.

(b) Table of Sines

(i.) Introduction

Ptolemy, Syntaxis i. 10, ed. Heiberg i. pars i. 31. 7-32. 9

10. On the lengths of the chords in a circle

With a view to obtaining a table ready for immediate use, we shall next set out the lengths of these [chords in a circle], dividing the perimeter into 360 segments and by the side of the arcs placing the chords subtending them for every increase of half a degree, that is, stating how many parts they are of the diameter, which it is convenient for the numerical calculations to divide into 120 segments. But first we shall show how to establish a systematic and rapid method of calculating the lengths of the chords by means of the uniform use of the smallest possible number of propositions, so that we may not only have the sizes of the chords set out correctly, but may obtain a convenient proof of the method of calculating them based on geometrical considera-

μέντοι χρησόμεθα ταῖς τῶν ἀριθμῶν ἐφόδοις κατὰ τὸν τῆς ἑξηκοντάδος τρόπον διὰ τὸ δύσχρηστον τῶν μοριασμῶν ἔτι τε τοῖς πολυπλασιασμοῖς καὶ μερισμοῖς ἀκολουθήσομεν τοῦ συνεγγίζοντος ἀεὶ καταστοχαζόμενοι, καὶ καθ' ὅσον ἂν τὸ παραλειπόμενον μηδενὶ ἀξιολόγῳ διαφέρη τοῦ πρὸς αἴσθησιν ἀκριβοῦς.

(ii.) sin 18° and sin 36°

Ibid. 32. 10-35. 16

"Εστω δὴ πρῶτον ἡμικύκλιον τὸ $AB\Gamma$ ἐπὶ διαμέτρου τῆς $A\Delta\Gamma$ περὶ κέντρον τὸ Δ , καὶ ἀπὸ τοῦ Δ τῆ $A\Gamma$ πρὸς ὀρθὰς γωνίας ἤχθω ἡ ΔB , καὶ τετμήσθω δίχα ἡ $\Delta\Gamma$ κατὰ τὸ E, καὶ ἐπεζεύχθω ἡ EB, καὶ κείσθω αὐτῆ ἴση ἡ EZ, καὶ ἐπεζεύχθω ἡ ZB. λέγω, ὅτι ἡ μὲν $Z\Delta$ δεκαγώνου ἐστὶν πλευρά, ἡ δὲ BZ πενταγώνου.

 b i.e., Z Δ is equal to the side of a regular decagon, and BZ to the side of a regular pentagon, inscribed in the circle ABT.

a By διὰ τῆς ἐκ τῶν γραμμῶν μεθοδικῆς συστάσεως Ptolemy meant more than a graphical method; the phrase indicates a rigorous proof by means of geometrical considerations, as will be seen when the argument proceeds; cf. the use of διὰ τῶν γραμμῶν infra, p. 434. It may be inferred, therefore, that when Hipparchus proved "by means of lines" (διὰ τῶν γραμμῶν, On the Phaenomena of Eudoxus and Aratus, ed. Manitius 148-150) certain facts about the risings of stars, he used rigorous, and not merely graphical calculations; in other words, he was familiar with the main formulae of spherical trigonometry.

tions.^a In general we shall use the sexagesimal system for the numerical calculations owing to the inconvenience of having fractional parts, especially in multiplications and divisions, and we shall aim at a continually closer approximation, in such a manner that the difference from the correct figure shall be inappreciable and imperceptible.

(ii.) sin 18° and sin 36° Ibid, 32, 10–35, 16

First, let $AB\Gamma$ be a semicircle on the diameter $A\Delta\Gamma$ and with centre Δ , and from Δ let ΔB be drawn per-

pendicular to A Γ , and let $\Delta\Gamma$ be bisected at E, and let EB be joined, and let EZ be placed equal to it, and let ZB be joined. I say that $Z\Delta$ is the side of a decagon, and BZ of a pentagon.

"Επεὶ γὰρ εὐθεῖα γραμμή ή ΔΓ τέτμηται δίχα κατὰ τὸ Ε, καὶ πρόσκειταί τις αὐτῆ εὐθεῖα ἡ ΔΖ, κατά το Ε, και προσκειταί τις αὐτ $\hat{\eta}$ εὐθεία $\hat{\eta}$ ΔΖ, τὸ ὑπὸ τῶν ΓΖ καὶ ΖΔ περιεχόμενον ὀρθογώνιον μετὰ τοῦ ἀπὸ τῆς ΕΔ τετραγώνου ἴσον ἐστὶν τῷ ἀπὸ τῆς ΕΖ τετραγώνω, τουτέστιν τῷ ἀπὸ τῆς ΒΕ, ἐπεὶ ἴση ἐστὶν $\hat{\eta}$ ΕΒ τ $\hat{\eta}$ ΖΕ. ἀλλὰ τῷ ἀπὸ τῆς ΕΒ τετραγώνω ἴσα ἐστὶ τὰ ἀπὸ τῶν ΕΔ καὶ ΔΒ τετράγωνα· τὸ ἄρα ὑπὸ τῶν ΓΖ καὶ ΖΔ περιεχόμενον ὀρθογώνιον μετὰ τοῦ ἀπὸ τῆς ΔΕ τετραγώνου ἴσον έστὶν τοῖς ἀπὸ τῶν ΕΔ, ΔΒ τετραγώνοις. καὶ κοινοῦ ἀφαιρεθέντος τοῦ ἀπὸ της ΕΔ τετραγώνου λοιπόν το ύπο των ΓΖ καὶ ΖΔ ἴσον ἐστὶν τῷ ἀπὸ τῆς ΔΒ, τουτέστιν τῷ ἀπὸ της ΔΓ ή ΖΓ ἄρα ἄκρον καὶ μέσον λόγον τέτμηται κατὰ τὸ Δ. ἐπεὶ οὖν ἡ τοῦ έξαγώνου καὶ ἡ τοῦ δεκαγώνου πλευρά τῶν εἰς τὸν αὐτὸν κύκλον έγγραφομένων ἐπὶ τῆς αὐτῆς εὐθείας ἄκρον καὶ μέσον λόγον τέμνονται, ἡ δὲ $\Gamma\Delta$ ἐκ τοῦ κέντρου οὖσα τὴν τοῦ έξαγώνου περιέχει πλευράν, ἡ ΔΖ ἄρα ἐστὶν ἴση τῆ τοῦ δεκαγώνου πλευρậ. δμοίως δέ, ἐπεὶ ἡ τοῦ πενταγώνου πλευρὰ δύναται τήν τε τοῦ έξαγώνου καὶ τὴν τοῦ δεκαγώνου τῶν εἰς τὸν αὐτὸν κύκλον ἐγγραφομένων, τοῦ δὲ ΒΔΖ ορθογωνίου τὸ ἀπὸ τῆς ΒΖ τετράγωνον ἴσον ἐστὶν τῷ τε ἀπὸ τῆς $B\Delta$, ἥτις ἐστὶν ἑξαγώνου πλευρά, καὶ τῷ ἀπὸ τῆς ΔZ , ἥτις ἐστὶν δεκαγώνου πλευρά, ἡ BZ ἄρα ἴση ἐστὶν τῆ τοῦ πενταγώνου πλευρᾶ.

'Επεὶ οὖν, ὡς ἔφην, ὑποτιθέμεθα τὴν τοῦ κύκλου διάμετρον τμημάτων ρκ, γίνεται διὰ τὰ προκείμενα ἡ μὲν ΔΕ ἡμίσεια οὖσα τῆς ἐκ τοῦ κέντρου

^a Following the usual practice, I shall denote segments $(\tau \mu \dot{\eta} \mu a \tau a)$ of the diameter by $^{\nu}$, sixtieth parts of a $\tau \mu \dot{\eta} \mu a$ by 416

For since the straight line $\Delta\Gamma$ is bisected at E, and the straight line ΔZ is added to it,

$$\Gamma Z \cdot Z\Delta + E\Delta^2 = EZ^2$$
 [Eucl. ii. 6 = BE²,

since EB = ZE.

But

$$E\Delta^2 + \Delta B^2 = EB^2$$
; [Eucl. i. 47]

therefore $\Gamma Z \cdot Z \wedge + E \wedge^2 = E \wedge^2 + A B^2$

When the common term $E\Delta^2$ is taken away.

 $\Gamma Z \cdot Z \Delta = \Delta B^2$ the remainder

i.e.,
$$= \Delta \Gamma^2 ;$$

therefore $Z\Gamma$ is divided in extreme and mean ratio at Δ [Eucl. vi., Def. 3]. Therefore, since the side of the hexagon and the side of the decagon inscribed in the same circle when placed in one straight line are cut in extreme and mean ratio [Eucl. xiii. 9], and $\Gamma\Delta$, being a radius, is equal to the side of the hexagon [Eucl. iv. 15, coroll.], therefore ΔZ is equal to the side of the decagon. Similarly, since the square on the side of the pentagon is equal to the rectangle contained by the side of the hexagon and the side of the decagon inscribed in the same circle [Eucl. xiii. 10], and in the right-angled triangle B∆Z the square on BZ is equal [Eucl. i. 47] to the sum of the squares on B Δ , which is a side of the hexagon, and ΔZ , which is a side of the decagon, therefore BZ is equal to the side of the pentagon.

Then since, as I said, we made the diameter a consist of 120^p , by what has been stated ΔE , being half the numeral with a single accent, and second-sixtieths by the numeral with two accents. As the circular associations of the system tend to be forgotten, and it is used as a general system of enumeration, the same notation will be used for the squares of parts.

τμημάτων λ καὶ τὸ ἀπ' αὐτῆς λ, ἡ δὲ ΒΔ ἐκ τοῦ κέντρου οὖσα τμημάτων ξ καὶ τὸ ἀπὸ αὐτῆς . γχ. τὸ δὲ ἀπὸ τῆς ΕΒ, τουτέστιν τὸ ἀπὸ τῆς ΕΖ, τῶν έπὶ τὸ αὐτὸ δφ. μήκει ἄρα ἔσται ή ΕΖ τμημάτων Εζ δ νε έγγιστα, καὶ λοιπή ή ΔΖ τῶν αὐτῶν λζ δ νε. ή ἄρα τοῦ δεκαγώνου πλευρά, ὑποτείνουσα δε περιφέρειαν τοιούτων λς, οίων εστίν δ κύκλος $\overline{\tau \xi}$, τοιούτων έσται $\overline{\lambda \zeta}$ $\overline{\delta}$ $\overline{\nu \epsilon}$, οίων ή διάμετρος $\overline{\rho \kappa}$. πάλιν ἐπεὶ ἡ μὲν ΔΖ τμημάτων ἐστὶ λίζ δ νε, τὸ δὲ ἀπὸ αὐτῆς στοε δ τε, ἔστι δὲ καὶ τὸ ἀπὸ τῆς ΔΒ τῶν αὐτῶν γχ, ἃ συντεθέντα ποιεῖ τὸ ἀπὸ τῆς BZ τετράγωνον δδος δ ῖε, μήκει ἄρα ἔσται $\dot{\eta}$ BZ τμημάτων \bar{o} $\overline{\lambda \beta}$ $\bar{\gamma}$ έγγιστα. καὶ $\dot{\eta}$ τοῦ πενταγώνου ἄρα πλευρά, ὑποτείνουσα δὲ μοίρας οβ, οίων έστιν ο κύκλος $\overline{\tau\xi}$, τοιούτων έστιν \overline{o} $\overline{\lambda\beta}$ \overline{v} . οίων ή διάμετρος ρκ.

Φανερὸν δὲ αὐτόθεν, ὅτι καὶ ἡ τοῦ έξαγώνου πλευρά, ὑποτείνουσα δὲ μοίρας ξ̄, καὶ ἴση οὖσα τῆ ἐκ τοῦ κέντρου, τμημάτων ἐστὶν ξ̄. ὁμοίως δέ, ἐπεὶ ἡ μὲν τοῦ τετραγώνου πλευρά, ὑποτείνουσα δὲ μοίρας Ϛ̄, δυνάμει διπλασία ἐστὶν τῆς ἐκ τοῦ κέντρου, ἡ δὲ τοῦ τριγώνου πλευρά, ὑποτείνουσα δὲ μοίρας ρ̄κ, δυνάμει τῆς αὐτῆς ἐστιν τριπλασίων, τὸ δὲ ἀπὸ τῆς ἐκ τοῦ κέντρου τμημάτων ἐστὶν $\overline{\gamma \chi}$, συναχθήσεται τὸ μὲν ἀπὸ τῆς τοῦ τετραγώνου πλευρᾶς ζ̄σ, τὸ δὲ ἀπὸ τῆς τοῦ τριγώνου Μ̄ ω̄. ὥστε καὶ μήκει ἡ μὲν τὰς $\overline{\varsigma}$ μοίρας ὑποτείνουσα εὐθεῖα τοιούτων ἔσται $\overline{π}$ δ \overline{v} α $\overline{\iota}$ ἔγγιστα, οἴων ἡ $\overline{\iota}$ 18

of the radius, consists of 30^p and its square of 900^p , and $B\Delta$, being the radius, consists of 60^p and its square of 3600^p , while EB^2 , that is EZ^2 , consists of 4500^p ; therefore EZ is approximately 67^p 4′ 55'', and the remainder ΔZ is 37^p 4′ 55''. Therefore the side of the decagon, subtending an arc of 36° (the whole circle consisting of 360°), is 37^p 4′ 55'' (the diameter being 120^p). Again, since ΔZ is 37^p 4′ 55'', its square is 1375^p 4′ 15'', and the square on ΔB is 3600^p , which added together make the square on BZ 4975^p 4′ 15'', so that BZ is approximately 70^p 32' 3''. And therefore the side of the pentagon, subtending 72° (the circle consisting of 360°), is 70^p 32' 3'' (the diameter being 120^p).

Hence it is clear that the side of the hexagon, subtending 60° and being equal to the radius, is 60°. Similarly, since the square on the side of the square, b subtending 90°, is double of the square on the radius, and the square on the side of the triangle, subtending 120°, is three times the square on the radius, while the square on the radius is 3600°, the square on the side of the square is 7200° and the square on the side of the triangle is 10800°. Therefore the chord subtending 90° is approximately 84° 51′ 10″ (the diameter

 a Theon's proof that $\sqrt{4500}$ is approximately 67 p 4′ 55″ has already been given (vol. i. pp. 56-61).

b This is, of course, the square itself; the Greek phrase is not so difficult. We could translate, "the second power of the side of the square," but the notion of powers was outside the ken of the Greek mathematician.

διάμετρος $\overline{
ho \kappa}$, $\dot{\eta}$ δ $\dot{\epsilon}$ τ \dot{a} ς $\overline{
ho \kappa}$ τ $\hat{\omega}$ ν $a\dot{v}$ τ $\hat{\omega}$ ν $\overline{
ho \gamma}$

(iii.)
$$sin^2 \theta + cos^2 \theta = 1$$

Ibid. 35. 17-36. 12

Αΐδε μὲν οὕτως ἡμῖν ἐκ προχείρου καὶ καθ' αὐτὰς εἰλήφθωσαν, καὶ ἔσται φανερὸν ἐντεῦθεν, ὅτι τῶν διδομένων εὐθειῶν ἐξ εὐχεροῦς δίδονται καὶ αἱ ὑπὸ τὰς λειπούσας εἰς τὸ ἡμικύκλιον περιφερείας ὑποτείνουσαι διὰ τὸ τὰ ἀπ' αὐτῶν συντιθέμενα ποιεῖν τὸ ἀπὸ τῆς διαμέτρου τετράγωνον οἶον, ἐπειδη ἡ ὑπὸ τὰς λ̄ς μοίρας εὐθεῖα τμημάτων ἐδείχθη λζ δ $\overline{\nu}$ ε καὶ τὸ ἀπ' αὐτῆς $\overline{\rho}$ ατοε $\overline{\rho}$ $\overline{\rho}$ ς τὸ

δὲ ἀπὸ τῆς διαμέτρου τμημάτων ἐστὶν Μ΄ δυ, ἔσται καὶ τὸ μὲν ἀπὸ τῆς ὑποτεινούσης τὰς λειπούσας εἰς τὸ ἡμικύκλιον μοίρας ρμδ τῶν λοιπῶν

as to meet OB in K and the circle again in A'. Then

$$\sin \alpha (=\sin AB) = \frac{AK}{AO} = \frac{\frac{1}{2}AA'}{AO}$$

And AA' is the chord subtended by double of the arc AB, while Ptolemy expresses the lengths of chords as so many 120th parts of the diameter; therefore sin a is half the chord subtended by an angle 2a at the centre, which is conveniently abbreviated by

Heath to ½(crd. 2a), or, as we may alternatively express the relationship, sin AB is "half the chord subtended by 420

 $^{^{\}alpha}$ Let AB be a chord of a circle subtending an angle α at the centre O, and let AKA' be drawn perpendicular to OB so

consisting of 120°), and the chord subtending 120° is 103° 55′ 23″.a

(iii.)
$$sin^2 \theta + cos^2 \theta = 1$$

Ibid. 35, 17–36, 12

The lengths of these chords have thus been obtained immediately and by themselves, b and it will be thence clear that, among the given straight lines, the lengths are immediately given of the chords subtending the remaining arcs in the semicircle, by reason of the fact that the sum of the squares on these chords is equal to the square on the diameter; for example, since the chord subtending 36° was shown to be 37° 4′ 55″ and its square 1375° 4′ 15″, while the square on the diameter is 14400°, therefore the square on the chord subtending the remaining 144° in the semicircle is

double of the arc AB," which is the Ptolemaic form; as Ptolemy means by this expression precisely what we mean by sin AB, I shall interpolate the trigonometrical notation in the translation wherever it occurs. It follows that $\cos \alpha$ [$=\sin(90-\alpha)$]= $\frac{1}{2}$ crd. ($180^{\circ}-2\alpha$), or, as Ptolemy says, "half the chord subtended by the remaining angle in the semicircle." Tan α and the other trigonometrical ratios were not used by the Greeks.

In the passage to which this note is appended Ptolemy proves that

```
side of decagon (=crd. 36^{\circ} = 2 \sin 18^{\circ})=37^{p} 4' 55'', side of pentagon (=crd. 72^{\circ} = 2 \sin 36^{\circ})=70^{p} 32' 3'', side of hexagon (=crd. 60^{\circ} = 2 \sin 30^{\circ})=60^{p}, side of square (=crd. 90^{\circ} = 2 \sin 45^{\circ})=84^{p} 51' 10'', side of equilateral (=crd. 120^{\circ} = 2 \sin 60^{\circ})=103^{p} 55' 23''. triangle
```

b i.e., not deduced from other known chords.

(iv.) "Ptolemy's Theorem"

Ibid. 36. 13-37. 18

"Εστω γὰρ κύκλος ἐγγεγραμμένον ἔχων τετράπλευρον τυχὸν τὸ ΑΒΓΔ, καὶ ἐπεζεύχθωσαν αἱ ΑΓ καὶ ΒΔ. δεικτέον, ὅτι τὸ ὑπὸ τῶν ΑΓ καὶ ΒΔ περιεχόμενον ὀρθογώνιον ἴσον ἐστὶ συναμφοτέροις τῷ τε ὑπὸ τῶν ΑΒ, ΔΓ καὶ τῷ ὑπὸ τῶν ΑΔ, ΒΓ.

Κείσθω γὰρ τῆ ὑπὸ τῶν ΔΒΓ γωνία ἴση ἡ ὑπὸ ΑΒΕ. ἐὰν οὖν κοινὴν προσθῶμεν τὴν ὑπὸ ΕΒΔ,

^{**} i.e., crd. $144^{\circ}(=2 \sin 72^{\circ})=114^{\circ}$ 7' 37". If the given chord subtends an angle 2θ at the centre, the chord subtended by the remaining arc in the semicircle subtends an angle $(180-2\theta)$, and the theorem asserts that

 $^{(\}operatorname{crd}. 2\theta)^{2} + (\operatorname{crd}. \overline{180 - 2\theta})^{2} = (\operatorname{diameter})^{2},$ or $\sin^{2} \theta + \cos^{2} \theta = 1.$ 492

 13024^{p} 55′ 45″ and the chord itself is approximately 114^{p} 7′ 37″, and similarly for the other chords.^a

We shall explain in due course the manner in which the remaining chords obtained by subdivision can be calculated from these, setting out by way of preface this little lemma which is exceedingly useful for the business in hand.

(iv.) "Ptolemy's Theorem" Ibid. 36. 13-37. 18

Let $AB\Gamma\Delta$ be any quadrilateral inscribed in a circle, and let $A\Gamma$ and $B\Delta$ be joined. It is required to prove that the rectangle contained by $A\Gamma$ and $B\Delta$ is equal to the sum of the rectangles contained by AB, $\Delta\Gamma$ and $A\Delta$, $B\Gamma$.

For let the angle ABE be placed equal to the angle

 $\Delta B\Gamma$. Then if we add the angle $EB\Delta$ to both, the

ἔσται καὶ ἡ ὑπὸ ΑΒΔ γωνία ἴση τῆ ὑπὸ ΕΒΓ. ἔστιν δὲ καὶ ἡ ὑπὸ ΒΔΑ τῆ ὑπὸ ΒΓΕ ἴση· τὸ γὰρ αὐτὸ τμῆμα ὑποτείνουσιν· ἰσογώνιον ἄρα ἐστὶν τὸ ΑΒΔ τρίγωνον τῷ ΒΓΕ τριγώνῳ. ὥστε καὶ ἀνάλογόν ἐστιν, ὡς ἡ ΒΓ πρὸς τὴν ΓΕ, οὕτως ἡ ΒΔ πρὸς τὴν ΔΑ· τὸ ἄρα ὑπὸ ΒΓ, ΑΔ ἴσον ἐστὶν τῷ ὑπὸ ΒΔ, ΓΕ. πάλιν ἐπεὶ ἴση ἐστὶν ἡ ὑπὸ ΑΒΕ γωνία τῆ ὑπὸ ΔΒΓ γωνία, ἔστιν δὲ καὶ ἡ ὑπὸ ΒΑΕ ἴση τῆ ὑπὸ ΒΔΓ, ἰσογώνιον ἄρα ἐστὶν τὸ ΑΒΕ τρίγωνον τῷ ΒΓΔ τριγώνῳ· ἀνάλογον ἄρα ἐστίν, ὡς ἡ ΒΑ πρὸς ΑΕ, ἡ ΒΔ πρὸς ΔΓ· τὸ ἄρα ὑπὸ ΒΑ, ΔΓ ἴσον ἐστὶν τῷ ὑπὸ ΒΔ, ΑΕ. ἐδείχθη δὲ καὶ τὸ ὑπὸ ΒΓ, ΑΔ ἴσον τῷ ὑπὸ ΒΔ, ΓΕ· καὶ ὅλον ἄρα τὸ ὑπὸ ΑΓ, ΒΔ ἴσον ἐστὶν συναμφοτέροις τῷ τε ὑπὸ ΑΒ, ΔΓ καὶ τῷ ὑπὲρ ΑΔ, ΒΓ· ὅπερ ἔδει δεῖξαι.

(v.) $sin(\theta - \phi) = sin \theta cos \phi - cos \theta sin \phi$ lbid, 37, 19-39, 3

Τούτου προεκτεθέντος ἔστω ἡμικύκλιον τὸ $AB\Gamma\Delta$ ἐπὶ διαμέτρου τῆς $A\Delta$, καὶ ἀπὸ τοῦ A δύο διήχθωσαν αἱ AB, $A\Gamma$, καὶ ἔστω ἑκατέρα αὐτῶν δοθεῖσα τῷ μεγέθει, οἴων ἡ διάμετρος δοθεῖσα $\overline{\rho\kappa}$, καὶ ἐπεζεύχθω ἡ $B\Gamma$. λέγω, ὅτι καὶ αὕτη δέδοται.

' Επεζεύχθωσαν γὰρ αἱ $B\Delta$, $\Gamma\Delta$ · δεδομέναι ἄρα εἰσὶν δηλονότι καὶ αὖται διὰ τὸ λείπειν ἐκείνων εἰς τὸ ἡμικύκλιον. ἐπεὶ οὖν ἐν κύκλω τετράπλευρόν ἐστιν τὸ $AB\Gamma\Delta$, τὸ ἄρα ὑπὸ AB, $\Gamma\Delta$ μετὰ τοῦ 424

angle $AB\Delta$ =the angle $EB\Gamma$. But the angle $B\Delta A$ =the angle $B\Gamma E$ [Eucl. iii. 21], for they subtend the same segment; therefore the triangle $AB\Delta$ is equiangular with the triangle $B\Gamma E$.

$$B\Gamma : \Gamma E = B\Delta : \Delta A; \qquad [Eucl. vi. 4]$$

$$B\Gamma : A\Delta = B\Delta \cdot \Gamma E. \qquad [Eucl. vi. 6]$$

Again, since the angle ABE is equal to the angle $\Delta B\Gamma$, while the angle BAE is equal to the angle B $\Delta\Gamma$ [Eucl. iii. 21], therefore the triangle ABE is equiangular with the triangle B $\Gamma\Delta$;

$$\therefore BA : AE = B\Delta : \Delta\Gamma; \qquad [Fuel. vi. 4]$$

$$\therefore BA : \Delta\Gamma = B\Delta . AE. \qquad [Fuel. vi. 6]$$

But it was shown that

$$B\Gamma \cdot A\Delta = B\Delta \cdot \Gamma E$$
;

and ..
$$A\Gamma \cdot B\Delta = AB \cdot \Delta\Gamma + A\Delta \cdot B\Gamma ;$$
 [Eucl. ii. 1

which was to be proved.

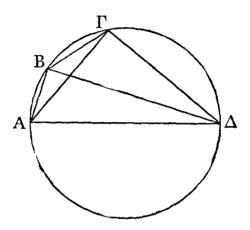

(v.)
$$\sin (\theta - \phi) = \sin \theta \cos \phi - \cos \theta \sin \phi$$

Ibid. 37. 19–39. 3

This having first been proved, let $AB\Gamma\Delta$ be a semicircle having $A\Delta$ for its diameter, and from A let the two [chords] AB, AF be drawn, and let each of them be given in length, in terms of the 120 p in the diameter, and let BF be joined. I say that this also is given.

For let $B\Delta$, $\Gamma\Delta$ be joined; then clearly these also are given because they are the chords subtending the remainder of the semicircle. Then since $AB\Gamma\Delta$ is a quadrilateral in a circle,

ύπὸ τῶν ΑΔ, ΒΓ ἴσον ἐστὶν τῷ ὑπὸ ΑΓ, ΒΔ. καί ἐστιν τό τε ὑπὸ τῶν ΑΓ, Β΄Δ δοθὲν καὶ τὸ

ύπὸ AB, ΓΔ· καὶ λοιπὸν ἄρα τὸ ὑπὸ AΔ, ΒΓ δοθέν ἐστιν. καί ἐστιν ἡ AΔ διάμετρος· δοθεῖσα ἄρα ἐστὶν καὶ ἡ ΒΓ εὐθεῖα.

Καὶ φανερὸν ἡμῖν γέγονεν, ὅτι, ἐὰν δοθῶσιν δύο περιφέρειαι καὶ αἱ ὑπ' αὐτὰς εὐθεῖαι, δοθεῖσα ἔσται καὶ ἡ τὴν ὑπεροχὴν τῶν δύο περιφερειῶν ὑποτείνουσα εὐθεῖα. δῆλον δέ, ὅτι διὰ τούτου τοῦ θεωρήματος ἄλλας τε οὐκ ὀλίγας εὐθείας ἐγγράψομεν ἀπὸ τῶν ἐν ταῖς καθ' αὐτὰς δεδομένων ὑπεροχῶν καὶ δὴ καὶ τὴν ὑπὸ τὰς δώδεκα μοίρας, ἐπειδήπερ ἔχομεν τήν τε ὑπὸ τὰς ξ̄ καὶ τὴν ὑπὸ τὰς οβ.

$$AB$$
 , $\Gamma\Delta + A\Delta$, $B\Gamma = A\Gamma$, $B\Delta$

[" Ptolemy's theorem "

And A Γ . B Δ is given, and also AB . $\Gamma\Delta$; therefore the remaining term A Δ . B Γ is also given. And A Δ is the diameter; therefore the straight line B Γ is given.

And it has become clear to us that, if two arcs are given and the chords subtending them, the chord subtending the difference of the arcs will also be given. It is obvious that, by this theorem we can inscribe b many other chords subtending the difference between given chords, and in particular we may obtain the chord subtending 12°, since we have that subtending 60° and that subtending 72°.

 a If AT subtends an angle 2θ and AB an angle 2ϕ at the centre, the theorem asserts that

crd.
$$2\theta - 2\phi$$
). (crd. 180°) = (crd. 2θ). (crd. $180^{\circ} - 2\phi$) - (crd. 2ϕ). (crd. $180^{\circ} - 2\theta$)

i.e.,
$$\sin (\theta - \phi) = \sin \theta \cos \phi - \cos \theta \sin \phi.$$

b Or "calculate," as we might almost translate ἐγγράψομεν: cf. supra, p. 414 n. a on ἐκ τῶν γραμμῶν.

(vi.) $\sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$

Ibid. 39. 4-41. 3

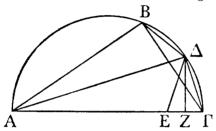

Πάλιν προκείσθω δοθείσης τινὸς εὐθείας ἐν κύκλῳ τὴν ὑπὸ τὸ ἥμισυ τῆς ὑποτεινομένης περιφέρείας εὐθεῖαν εὑρεῖν. καὶ ἔστω ἡμικύκλιον τὸ ΑΒΓ ἐπὶ διαμέτρου τῆς ΑΓ καὶ δοθεῖσα εὐθεῖα ἡ ΓΒ, καὶ ἡ ΓΒ περιφέρεια δίχα τετμήσθω κατὰ τὸ Δ, καὶ ἐπεζεύχθωσαν αὶ ΑΒ, ΑΔ, ΒΔ, ΔΓ, καὶ ἀπὸ τοῦ Δ ἐπὶ τὴν ΑΓ κάθετος ἤχθω ἡ ΔΖ. λέγω, ὅτι ἡ ΖΓ ἡμίσειά ἐστι τῆς τῶν ΑΒ καὶ ΑΓ ὑπεροχῆς.

Κείσθω γὰρ τῆ ΑΒ ἴση ἡ ΑΕ, καὶ ἐπεζεύχθω ἡ ΔΕ. ἐπεὶ ἴση ἐστὶν ἡ ΑΒ τῆ ΑΕ, κοινὴ δὲ ἡ ΑΔ, δύο δὴ αἱ ΑΒ, ΑΔ δύο ταῖς ΑΕ, ΑΔ ἴσαι εἰσὶν ἑκατέρα ἑκατέρα. καὶ γωνία ἡ ὑπὸ ΒΑΔ γωνία τῆ ὑπὸ ΕΑΔ ἴση ἐστίν· καὶ βάσις ἄρα ἡ ΒΔ βάσει τῆ ΔΕ ἴση ἐστίν· αἰλὰ ἡ ΒΔ τῆ ΔΓ ἴση ἐστίν· καὶ ἡ ΔΓ ἄρα τῆ ΔΕ ἴση ἐστίν· ἐπεὶ οὖν ἰσοσκελοῦς ὄντος τριγώνου τοῦ ΔΕΓ ἀπὸ τῆς κορυφῆς ἐπὶ τὴν βάσιν κάθετος ἡκται ἡ ΔΖ, ἴση ἐστὶν ἡ ΕΖ τῆ ΖΓ. ἀλλ' ἡ ΕΓ ὅλη ἡ ὑπεροχή ἐστιν τῶν ΑΒ καὶ ΑΓ εὐθειῶν· ἡ ἄρα ΖΓ ἡμίσειά ἐστιν τῆς τῶν αὐτῶν ὑπεροχῆς. ὥστε, ἐπεὶ τῆς ὑπὸ τὴν ΒΓ περιφέρειαν εὐθείας ὑποκειμένης 428

(vi.)
$$\sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$$

Ibid. 39. 4-41. 3

Again, given any chord in a circle, let it be required to find the chord subtending half the arc subtended by the given chord. Let $AB\Gamma$ be a semicircle upon the diameter $A\Gamma$ and let the chord ΓB be given, and

let the arc ΓB be bisected at Δ , and let AB, $A\Delta$, $B\Delta$, $\Delta\Gamma$ be joined, and from Δ let ΔZ be drawn perpendicular to $A\Gamma$. I say that $Z\Gamma$ is half of the difference between AB and $A\Gamma$.

For let AE be placed equal to AB, and let ΔE be joined. Since AB=AE and $A\Delta$ is common, [in the triangles $AB\Delta$, $AE\Delta$] the two [sides] AB, $A\Delta$ are equal to AE, $A\Delta$ each to each; and the angle $BA\Delta$ is equal to the angle $EA\Delta$ [Eucl. iii. 27]; and therefore the base $B\Delta$ is equal to the base ΔE [Eucl. i. 4]. But $B\Delta=\Delta\Gamma$; and therefore $\Delta\Gamma=\Delta E$. Then since the triangle $\Delta E\Gamma$ is isosceles and ΔZ has been drawn from the vertex perpendicular to the base, $EZ=Z\Gamma$ [Eucl. i. 26]. But the whole $E\Gamma$ is the difference between the chords AB and $A\Gamma$; therefore $Z\Gamma$ is half of the difference. Thus, since the chord subtending the arc $B\Gamma$ is given, the chord AB subtending the remainder

αὐτόθεν δέδοται καὶ ἡ λείπουσα εἰς τὸ ἡμικύκλιον ἡ ΑΒ, δοθήσεται καὶ ἡ ΖΓ ἡμίσεια οὖσα τῆς τῶν ΑΓ καὶ ΑΒ ὑπεροχῆς: ἀλλὶ ἐπεὶ ἐν ὀρθογωνίω τῷ ΑΓΔ καθέτου ἀχθείσης τῆς ΔΖ ἰσογώνιον γίνεται τὸ ΑΔΓ ὀρθογώνιον τῷ ΔΓΖ, καὶ ἐστιν, ὡς ἡ ΑΓ πρὸς ΓΔ, ἡ ΓΔ πρὸς ΓΖ, τὸ ἄρα ὑπὸ τῶν ΑΓ, ΓΖ περιεχόμενον ὀρθογώνιον ἴσον ἐστὶν τῷ ἀπὸ τῆς ΓΔ τετραγώνω. δοθὲν δὲ τὸ ὑπὸ τῶν ΑΓ, ΓΖ. δοθὲν ἄρα ἐστὶν καὶ τὸ ἀπὸ τῆς ΓΔ τετράγωνον. ὥστε καὶ μήκει ἡ ΓΔ εὐθεῖα δοθήσεται τὴν ἡμίσειαν ὑποτείνουσα τῆς ΒΓ περιφερείας.

Καί διὰ τούτου δὴ πάλιν τοῦ θεωρήματος ἄλλαι τε ληφθήσονται πλεῖσται κατὰ τὰς ἡμισείας τῶν προεκτεθειμένων, καὶ δὴ καὶ ἀπὸ τῆς τὰς \mathbf{i} μοίρας ὑποτεινούσης εὐθείας ἢ τε ὑπὸ τὰς \mathbf{j} καὶ ἡ ὑπὸ τὴν μίαν ἤμισυ καὶ ἡ ὑπὸ τὸ ἤμισυ τέταρτον τῆς μιᾶς μοίρας. εὑρίσκομεν δὲ ἐκ τῶν ἐπιλογισμῶν τὴν μὲν ὑπὸ τὴν μίαν ἤμισυ μοῖραν τοιούτων \mathbf{a} λδ \mathbf{i} ἔγγιστα, οἴων ἐστὶν ἡ διάμετρος \mathbf{p} κ, τὴν δὲ ὑπὸ τὸ \mathbf{L}' δ' τῶν αὐτῶν \mathbf{O} μζ $\mathbf{\bar{j}}$.

 $\nu \cup \mu \cup \eta$.

(vii.) $cos(\theta + \phi) = cos \theta cos \phi - sin \theta sin \phi$ Ibid. 41. 4-43. 5

Πάλιν ἔστω κύκλος ὁ ΑΒΓΔ περὶ διάμετρον μὲν τὴν ΑΔ, κέντρον δὲ τὸ Ζ, καὶ ἀπὸ τοῦ Α ἀπειλήφθωσαν δύο περιφέρειαι δοθεῖσαι κατὰ τὸ έξῆς αἱ ΑΒ, ΒΓ, καὶ ἐπεζεύχθωσαν αἱ ΑΒ, ΒΓ ὑπ' αὐτὰς εὐθεῖαι καὶ αὐταὶ δεδομέναι. λέγω ὅτι, ἐὰν ἐπιζεύξωμεν τὴν ΑΓ, δοθήσεται καὶ αὐτή.

 $[^]a$ If BT subtends an angle 2θ at the centre the proposition asserts that

of the semicircle is immediately given, and $Z\Gamma$ will also be given, being half of the difference between $A\Gamma$ and AB. But since the perpendicular ΔZ has been drawn in the right-angled triangle $A\Gamma\Delta$, the right-angled triangle $A\Delta\Gamma$ is equiangular with $\Delta\Gamma Z$ [Eucl. vi. 8], and

 $A\Gamma : \Gamma\Delta = \Gamma\Delta : \Gamma Z$

and therefore

A Γ . $\Gamma Z = \Gamma \Delta^2$.

But A Γ . ΓZ is given; therefore $\Gamma \Delta^2$ is also given. Therefore the chord $\Gamma \Delta$, subtending half of the arc

B Γ , is also given.^a

And again by this theorem many other chords can be obtained as the halves of known chords, and in particular from the chord subtending 12° can be obtained the chord subtending 6° and that subtending 3° and that subtending $1\frac{1}{2}^{\circ}$ and that subtending $\frac{1}{2}^{\circ} + \frac{1}{4}^{\circ} (= \frac{3}{4}^{\circ})$. We shall find, when we come to make the calculation, that the chord subtending $1\frac{1}{2}^{\circ}$ is approximately $1^{\mathfrak{p}}$ $3^{\mathfrak{q}}$ is $1^{\mathfrak{p}}$ $1^{\mathfrak{p}}$ (the diameter being $120^{\mathfrak{p}}$) and that subtending $\frac{3}{4}^{\circ}$ is $0^{\mathfrak{p}}$ 47' 8''.

(vii.)
$$\cos (\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$$

 $Bid. 41. 4-43. 5$

Again, let $AB\Gamma\Delta$ be a circle about the diameter $A\Delta$ and with centre Z, and from A let there be cut off in succession two given arcs AB, B Γ , and let there be joined AB, B Γ , which, being the chords subtending them, are also given. I say that, if we join A Γ , it also will be given.

(crd. θ)² = $\frac{1}{2}$ (crd. 180). {(crd. 180°) – crd. $\overline{180° - 2\theta}$ } .e., $\sin^2 \frac{1}{2}\theta = \frac{1}{2}(1 - \cos \theta)$.

b The symbol in the Greek for O should be noted; v. vol. i. p. 47 n. a.

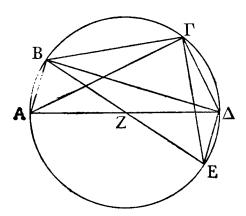

Διήχθω γὰρ διὰ τοῦ Β διάμετρος τοῦ κύκλου ή ΒΖΕ, καὶ ἐπεζεύχθωσαν αί ΒΔ, ΔΓ, ΓΕ, ΔΕ. δηλον δη αὐτόθεν, ὅτι διὰ μέν την ΒΓ δοθήσεται καὶ ή ΓΕ, διὰ δὲ τὴν ΑΒ δοθήσεται ή τε ΒΔ καὶ ή ΔΕ. καὶ διὰ τὰ αὐτὰ τοῖς ἔμπροσθεν, ἐπεὶ ἐν κύκλω τετράπλευρόν έστιν τὸ ΒΓΔΕ, καὶ διηγμέναι εἰσὶν αί ΒΔ, ΓΕ, τὸ ὑπὸ τῶν διηγμένων περιεγόμενον ορθογώνιον ἴσον ἐστὶν συναμφοτέροις τοις ύπὸ τῶν ἀπεναντίον ὤστε, ἐπεὶ δεδομένου τοῦ ὑπὸ τῶν ΒΔ, ΓΕ δέδοται καὶ τὸ ὑπὸ τῶν ΒΓ, ΔΕ, δέδοται ἄρα καὶ τὸ ὑπὸ ΒΕ, Γ Δ . δέδοται δὲ καὶ ἡ ΒΕ διάμετρος, καὶ λοιπὴ ἡ ΓΔ ἔσται δεδομένη, καὶ διὰ τοῦτο καὶ ἡ λείπουσα εἰς τὸ ήμικύκλιον ή ΓΑ· ὥστε, ἐὰν δοθῶσιν δύο περι-' φέρειαι καὶ αἱ ὑπ' αὐτὰς εὐθεῖαι, δοθήσεται καὶ ή συναμφοτέρας τὰς περιφερείας κατὰ σύνθεσιν ύποτείνουσα εὐθεῖα διὰ τούτου τοῦ θεωρήματος.

 $^{^{}a}$ If AB subtends an angle 2θ and BF an angle 2ϕ at the centre, the theorem asserts that

⁽erd. 180°). (erd. $180^{\circ} - 2\theta - 2\phi$) = (erd. $180^{\circ} - 2\theta$). (erd. $180^{\circ} - 2\phi$) - (erd. 2ϕ), (erd. 2ϕ),

i.e., $\cos (\theta + \phi) = \cos \theta \cos \phi - \sin \theta \sin \phi$.

For through B let BZE, the diameter of the circle, be drawn, and let $B\Delta$, $\Delta\Gamma$, ΓE , ΔE be joined; it is

then immediately obvious that, by reason of B Γ being given, Γ E is also given, and by reason of AB being given, both B Δ and Δ E are given. And by the same reasoning as before, since B Γ \DeltaE is a quadrilateral in a circle, and B Δ , Γ E are the diagonals, the rectangle contained by the diagonals is equal to the sum of the rectangles contained by the opposite sides. And so, since B Δ . Γ E is given, while B Γ . Δ E is also given, therefore BE. Γ \Delta is given. But the diameter BE is given, and [therefore] the remaining term Γ D will be given, and therefore the chord Γ A subtending the remainder of the semicircle Γ 3; accordingly, if two arcs be given, and the chords subtending them, by this theorem the chord subtending the sum of the arcs will also be given.

Φανερον δέ, ότι συντιθέντες ἀεὶ μετὰ τῶν προεκτεθειμένων πασῶν τὴν ὑπὸ ā Δ΄ μοῖραν καὶ τὰς συναπτομένας ἐπιλογιζόμενοι πάσας ἀπλῶς ἐγγράψομεν, ὅσαι δὶς γινόμεναι τρίτον μέρος ἔξουσιν, καὶ μόναι ἔτι περιλειφθήσονται αἱ μεταξὺ τῶν ἀνὰ ā Δ΄ μοῖραν διαστημάτων δύο καθ' εκαστον εσόμεναι, επειδήπερ καθ' ήμιμοίριον ποιούμεθα την εγγραφήν. ὥστε, εὰν την ὑπὸ τὸ ήμιμοίριον εὐθεῖαν εὕρωμεν, αὕτη κατά τε την σύνθεσιν καὶ τὴν ὑπεροχὴν τὴν πρὸς τὰς τὰ διαστήματα περιεχούσας καὶ δεδομένας εὐθείας καὶ τὰς λοιπὰς τὰς μεταξὺ πάσας ἡμῖν συνανα-πληρώσει. ἐπεὶ δὲ δοθείσης τινὸς εὐθείας ὡς τῆς ὑπὸ τὴν ā ∠΄ μοῖραν ἡ τὸ τρίτον τῆς αὐτῆς περιφερείας ύποτείνουσα διὰ τῶν γραμμῶν οὐ δίδοταί πως· εἰ δέ γε δυνατὸν ἦν, εἴχομεν ἂν αὐτόθεν καὶ τὴν ὑπὸ τὸ ἡμιμοίριον πρότερον μεθοδεύσομεν τὴν ὑπὸ τὴν ā μοῖραν ἀπό τε τῆς ὑπὸ τὴν ā ሬ΄ μοίραν καὶ τῆς ὑπὸ Δ΄ δ΄ ὑποτεθέμενοι λημμάτιον, ος, καν μη πρός το καθόλου δύνηται τας πηλικότητας δρίζειν, επί γε τῶν οὕτως ελαχίστων τὸ πρός τὰς ώρισμένας ἀπαράλλακτον δύναιτ' ἂν συντηρεῖν.

(viii.) Method of Interpolation Ibid. 43. 6-46. 20

Λέγω γάρ, ὅτι ἐὰν ἐν κύκλῳ διαχθῶσιν ἄνισοι δύο εὐθεῖαι, ἡ μείζων πρὸς τὴν ἐλάσσονα ἐλάσσονα λόγον ἔχει ἤπερ ἡ ἐπὶ τῆς μείζονος εὐθείας περιφέρεια πρὸς τὴν ἐπὶ τῆς ἐλάσσονος.

Έστω γὰρ κύκλος ὁ ΑΒΓΔ, καὶ διήχθωσαν ἐν αὐτῶ δύο εὐθεῖαι ἄνισοι ἐλάσσων μὲν ἡ ΑΒ,

It is clear that, by continually putting next to all known chords a chord subtending 13° and calculating the chords joining them, we may compute in a simple manner all chords subtending multiples of 110, and there will still be left only those within the $1\frac{1}{2}$ ° intervals—two in each case, since we are making the diagram in half degrees. Therefore, if we find the chord subtending 10, this will enable us to complete, by the method of addition and subtraction with respect to the chords bounding the intervals, both the given chords and all the remaining, intervening chords. But when any chord subtending, say, 13°, is given, the chord subtending the third part of the same arc is not given by the [above] calculations—if it were, we should obtain immediately the chord subtending $\frac{1}{2}$; therefore we shall first give a method for finding the chord subtending 1° from the chord subtending 110 and that subtending 110, assuming a little lemma which, even though it cannot be used for calculating lengths in general, in the case of such small chords will enable us to make an approximation indistinguishable from the correct figure.

(viii.) Method of Interpolation Ibid. 43. 6-46. 20

For I say that, if two unequal chords be drawn in a circle, the greater will bear to the less a less ratio than that which the arc on the greater chord bears to the arc on the lesser.

For let $AB\Gamma\Delta$ be a circle, and in it let there be drawn two unequal chords, of which AB is the lesser

μείζων δὲ ἡ ΒΓ. λέγω, ὅτι ἡ ΓΒ εὐθεῖα πρὸς τὴν ΒΑ εὐθεῖαν ἐλάσσονα λόγον ἔχει ἤπερ ἡ ΒΓ περιφέρεια πρὸς τὴν ΒΑ περιφέρειαν.

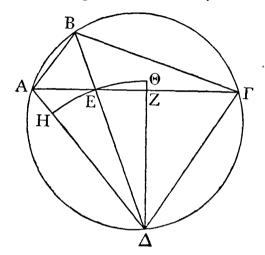

Τετμήσθω γὰρ ἡ ὑπὸ ΑΒΓ γωνία δίχα ὑπὸ τῆς ΒΔ, καὶ ἐπεζεύχθωσαν ή τε ΑΕΓ καὶ ή ΑΔ καὶ ή ΓΔ. καὶ ἐπεὶ ἡ ὑπὸ ΑΒΓ γωνία δίγα τέτμηται ύπὸ τῆς ΒΕΔ εὐθείας, ἴση μέν ἐστιν ἡ ΓΔ εὐθεῖα $\tau \hat{\eta} A \Delta$, $\mu \epsilon i \zeta \omega \nu \delta \hat{\epsilon} \dot{\eta} \Gamma E \tau \hat{\eta}_S E A$. $\mathring{\eta}_X \theta \omega \delta \dot{\eta} \dot{\alpha} \pi \dot{\delta}$ τοῦ Δ κάθετος ἐπὶ τὴν ΑΕΓ ἡ ΔΖ. ἐπεὶ τοίνυν μείζων ἐστὶν ἡ μὲν ΑΔ τῆς ΕΔ, ἡ δὲ ΕΔ τῆς ΔΖ, ό ἄρα κέντρω μὲν τῷ Δ, διαστήματι δὲ τῷ ΔΕ γραφόμενος κύκλος την μεν ΑΔ τεμεί, υπερπεσείται δὲ τὴν ΔΖ. γεγράφθω δὴ ὁ ΗΕΘ, καὶ εκβεβλήσθω ή ΔΖΘ. καὶ ἐπεὶ ὁ μὲν ΔΕΘ τομεὺς μείζων έστιν τοῦ ΔΕΖ τριγώνου, τὸ δὲ ΔΕΑ τρίγωνον μείζον τοῦ ΔΕΗ τομέως, τὸ ἄρα ΔΕΖ

^a Lit. " let ΔZΘ be produced."

and BF the greater. I say that

 $\Gamma B : BA < arc B\Gamma : arc BA.$

For let the angle AB Γ be bisected by B Δ , and let

AET and $A\Delta$ and $\Gamma\Delta$ be joined. Then since the angle ABT is bisected by the chord BE Δ , the chord $\Gamma\Delta=A\Delta$ [Eucl. iii. 26, 29], while $\Gamma E>EA$ [Eucl. vi. 3]. Now let ΔZ be drawn from Δ perpendicular to AET. Then since $A\Delta>E\Delta$, and $E\Delta>\Delta Z$, the circle described with centre Δ and radius ΔE will cut $A\Delta$, and will fall beyond ΔZ . Let [the arc] HE θ be described, and let ΔZ be produced to θ . Then since

sector $\Delta E\theta > \text{triangle } \Delta EZ$,

and triangle $\Delta EA > sector \Delta EH$,

τρίγωνον πρός τὸ ΔΕΑ τρίγωνον ἐλάσσονα λόγον έχει ήπερ ὁ ΔΕΘ τομεύς πρὸς τὸν ΔΕΗ. ἀλλ' ώς μέν τὸ ΔΕΖ τρίγωνον πρὸς τὸ ΔΕΑ τρίγωνον, ούτως ή ΕΖ εὐθεῖα πρὸς τὴν ΕΑ, ώς δὲ ὁ ΔΕΘ τομεύς πρός τον ΔΕΗ τομέα, ούτως ή ύπο ΖΔΕ γωνία πρὸς τὴν ὑπὸ ΕΔΑ: ἡ ἄρα ΖΕ εὐθεῖα πρὸς την ΕΑ ελάσσονα λόγον έχει ήπερ η ύπο ΖΔΕ γωνία πρὸς τὴν ὑπὸ ΕΔΑ. καὶ συνθέντι ἄρα ἡ ΖΑ εὐθεῖα πρὸς τὴν ΕΑ ἐλάσσονα λόγον ἔχει ήπερ ή ύπὸ ΖΔΑ γωνία πρὸς τὴν ὑπὸ ΑΔΕ καὶ τῶν ἡγουμένων τὰ διπλάσια, ἡ ΓΑ εὐθεῖα πρὸς τὴν ΑΕ ἐλάσσονα λόγον ἔχει ἤπερ ἡ ὑπὸ ΓΔΑ γωνία πρὸς τὴν ὑπὸ $\rm E\Delta A$ · καὶ διελόντι ἡ $\rm \Gamma E$ εὐθεῖα πρὸς τὴν $\rm EA$ ἐλάσσονα λόγον ἔχει ἤπερ ἡ ύπὸ ΓΔΕ γωνία πρὸς τὴν ὑπὸ ΕΔΑ. ἀλλ' ὡς μεν ή ΓΕ εὐθεῖα πρὸς τὴν ΕΑ, οὕτως ή ΓΒ εὐθεῖα πρὸς τὴν ΒΑ, ὡς δὲ ἡ ὑπὸ ΓΔΒ γωνία πρὸς τὴν ὑπὸ ΒΔΑ, οὕτως ἡ ΓΒ περιφέρεια πρὸς τὴν ΒΑ ή ΓΒ ἄρα εὐθεῖα πρὸς τὴν ΒΑ ἐλάσσονα λόγον έχει ήπερ ή ΓΒ περιφέρεια πρὸς τὴν ΒΑ περιφέρειαν.

Τούτου δὴ οὖν ὑποκειμένου ἔστω κύκλος ὁ ABΓ, καὶ διήχθωσαν ἐν αὐτῷ δύο εὐθεῖαι ἢ τε AB καὶ ἡ ΑΓ, ὑποκείσθω δὲ πρῶτον ἡ μὲν AB ὑποτείνουσα μιᾶς μοίρας Δ΄ δ΄, ἡ δὲ ΑΓ μοῖραν ἄ. ἐπεὶ ἡ ΑΓ εὐθεῖα πρὸς τὴν BA εὐθεῖαν ελάσσονα λόγον ἔχει ἤπερ ἡ ΑΓ περιφέρεια πρὸς τὴν AB, ἡ δὲ ΑΓ περιφέρεια ἐπίτριτός ἐστιν τῆς AB, ἡ ΓΑ ἄρα εὐθεῖα τῆς BA ἐλάσσων ἐστὶν ἢ ἐπίτριτος. ἀλλὰ ἡ AB εὐθεῖα ἐδείχθη τοιούτων Ο μζ ῆ, οἴων ἐστὶν ἡ διάμετρος ρκ· ἡ ἄρα ΓΑ

 \therefore triangle ΔEZ : triangle ΔEA < sector $\Delta E\theta$:

sector ΔEH .

But triangle ΔEZ : triangle $\Delta EA = EZ$: EA,

[Eucl. vi. 1

and

sector $\Delta E\Theta$: sector ΔEH = angle $Z\Delta E$: angle $E\Delta A$.

 $ZE : EA < angle Z\Delta E : angle E\Delta A.$

 \therefore componendo, ZA : EA < angle Z Δ A : angle A Δ E; and, by doubling the antecedents,

 $\Gamma A : AE < angle \Gamma \Delta A : angle E \Delta A ;$

and dirimendo, $\Gamma E:EA<$ angle $\Gamma \Delta E:$ angle $E\Delta A.$

But $\Gamma E : EA = \Gamma B : BA$, [Eucl. vi. 3

and

angle $\Gamma \Delta B$: angle $B\Delta A = arc \Gamma B$: arc BA;

[Eucl. vi. 33

.. ΓB: BA < arc ΓB: arc BA.a

On this basis, then, let $AB\Gamma$ be a circle, and in it let there be drawn the two chords AB and $A\Gamma$, and let it first be supposed that AB subtends an angle of $\frac{3}{4}$ ° and $A\Gamma$ an angle of 1°. Then since

 $A\Gamma : BA < arc A\Gamma : arc AB$,

while

arc A $\Gamma = \frac{4}{3}$ arc AB,

 \therefore $\Gamma A : BA < \frac{4}{3}$.

But the chord AB was shown to be 0^p 47' 8" (the diameter being 120^p); therefore the chord ΓA

^a If the chords Γ B, BA subtend angles 2θ , 2ϕ at the centre, this is equivalent to the formula,

$$\frac{\sin \theta}{\sin \phi} < \frac{\theta}{\phi}$$

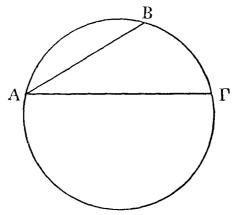

where $\theta < \phi < \frac{1}{2}\pi$.

εὐθεῖα ἐλάσσων ἐστὶν τῶν αὐτῶν $\bar{a}\ \bar{\beta}\ \bar{v}\cdot \tau$ αῦτα γὰρ ἐπίτριτά ἐστιν ἔγγιστα τῶν Ο $\overline{\mu} \bar{\zeta}\ \bar{\eta}$.

Πάλιν ἐπὶ τῆς αὐτῆς καταγραφῆς ἡ μὲν ΑΒ εὐθεῖα ὑποκείσθω ὑποτείνουσα μοῖραν ᾱ, ἡ δὲ ΑΓ μοίραν α Δ΄. κατά τὰ αὐτὰ δή, ἐπεὶ ἡ ΑΓ περιφέρεια της ΑΒ ἐστιν ἡμιολία, ἡ ΓΑ ἄρα εὐθεῖα της ΒΑ ελάσσων εστίν η ημιόλιος. άλλα την $A\Gamma$ $\vec{a}\pi\epsilon\delta\epsilon i\xi a\mu\epsilon\nu$ τοιούτων οὖσαν \vec{a} $\overline{\lambda\delta}$ $i\overline{\epsilon}$, οἵων έστιν ή διάμετρος ρκ. ή ἄρα ΑΒ εὐθεῖα μείζων $\vec{\epsilon} \sigma \tau i \nu \tau \hat{\omega} \nu \alpha \vec{v} \tau \hat{\omega} \nu \vec{a} \vec{\beta} \vec{\nu} \tau \sigma \hat{\upsilon} \tau \omega \nu \gamma \hat{\alpha} \rho \hat{\eta} \mu i$ όλιά έστιν τὰ προκείμενα ā λδ ιε. ωστε, έπεὶ των αὐτων έδείχθη καὶ μείζων καὶ έλάσσων ή τὴν μίαν μοιραν ύποτείνουσα εὐθεία, καὶ ταύτην δηλονότι έξομεν τοιούτων α β ν έγγιστα, οιων έστιν ή διάμετρος ρκ, καὶ διὰ τὰ προδεδειγμένα καὶ τὴν ύπὸ τὸ ἡμιμοίριον, ἤτις εύρίσκεται τῶν αὐτῶν

 $<1^{p}$ 2' 50"; for this is approximately four-thirds of 0^{p} 47' 8".

Again, with the same diagram, let the chord AB

be supposed to subtend an angle of 1°, and A Γ an angle of 1½°. By the same reasoning,

since

arc $A\Gamma = \frac{3}{2}$. arc AB,

 $\Gamma A : BA < \frac{3}{2}$.

But we have proved A Γ to be 1° 34′ 15″ (the diameter being 120°); therefore the chord AB>1° 2′ 50″; for 1° 34′ 15″ is one-and-a-half times this number. Therefore, since the chord subtending an angle of 1° has been shown to be both greater and less than [approximately] the same [length], manifestly we shall find it to have approximately this identical value 1° 2′ 50″ (the diameter being 120°), and by what has been proved before we shall obtain the chord subtending $\frac{1}{2}$ °, which is found to be approximately

Ο $\overline{\lambda a}$ $\overline{\kappa \epsilon}$ ἔγγιστα. καὶ συναναπληρωθήσεται τὰ λοιπά, ώς ἔφαμεν, διαστήματα ἐκ μὲν τῆς πρὸς τὴν μίαν ἥμισυ μοῖραν λόγου ἔνεκεν ὡς ἐπὶ τοῦ πρώτου διαστήματος συνθέσεως τοῦ ἡμιμοιρίου δεικνυμένης τῆς ὑπὸ τὰς $\overline{\beta}$ μοίρας, ἐκ δὲ τῆς ὑπεροχῆς τῆς πρὸς τὰς $\overline{\gamma}$ μοίρας καὶ τῆς ὑπὸ τὰς $\overline{\beta}$ \angle ΄ διδομένης. ὡσαύτως δὲ καὶ ἐπὶ τῶν λοιπῶν.

(ix.) The Table Ibid. 46, 21-63, 46

Ή μὲν οὖν πραγματεία τῶν ἐν τῷ κύκλῷ εὐθειῶν οὕτως ἄν οἷμαι ράστα μεταχειρισθείη. ἵνα δέ, ὡς ἔφην, ἐφ' ἐκάστης τῶν χρειῶν ἐξ ἐτοίμου τὰς πηλικότητας ἔχωμεν τῶν εὐθειῶν ἐκκειμένας, κανόνια ὑποτάξομεν ἀνὰ στίχους με διὰ τὸ σύμμετρον, ὧν τὰ μὲν πρῶτα μέρη περιέξει τὰς πηλικότητας τῶν περιφερειῶν καθ' ἡμιμοίριον παρηυξημένας, τὰ δὲ δεύτερα τὰς τῶν παρακειμένων ταῖς περιφερείαις εὐθειῶν πηλικότητας ὡς τῆς διαμέτρου τῶν ρκ τμημάτων ὑποκειμένης, τὰ δὲ τρίτα τὸ λ' μέρος τῆς καθ' ἔκαστον ἡμιμοίριον τῶν εὐθειῶν παραυξήσεως, ἵνα ἔχοντες καὶ τὴν τοῦ ἐνὸς ἐξηκοστοῦ μέσην ἐπιβολὴν ἀδιαφοροῦσαν πρὸς αἴσθησιν τῆς ἀκριβοῦς καὶ τῶν μεταξὺ τοῦ ἡμίσους μερῶν ἐξ ἐτοίμου τὰς ἐπιβαλλούσας πηλικότητας ἐπιλογίζεσθαι δυνώμεθα. εὐκατανόητον δ', ὅτι διὰ τῶν αὐτῶν καὶ προκειμένων θεωρημάτων, κᾶν ἐν δισταγμῷ γενώμεθα γραφικῆς ἁμαρτίας περί τινα τῶν ἐν τῷ κανονίῳ παρακειμένων εὐθειῶν, ράδίαν ποιησόμεθα τήν τε ἐξέτασιν καὶ τὴν 442

 0^p 31' 25". The remaining intervals may be completed, as we said, by means of the chord subtending $1\frac{1}{2}^{\circ}$ —in the case of the first interval, for example, by adding $\frac{1}{2}^{\circ}$ we obtain the chord subtending 2° , and from the difference between this and 3° we obtain the chord subtending $2\frac{1}{2}^{\circ}$, and so on for the remainder.

(ix.) The Table Ibid. 46, 21-63, 46

The theory of the chords in the circle may thus, I think, be very easily grasped. In order that, as I said, we may have the lengths of all the chords in common use immediately available, we shall draw up tables arranged in forty-five symmetrical rows.a The first section will contain the magnitudes of the arcs increasing by half degrees, the second will contain the lengths of the chords subtending the arcs measured in parts of which the diameter contains 120, and the third will give the thirtieth part of the increase in the chords for each half degree, in order that for every sixtieth part of a degree we may have a mean approximation differing imperceptibly from the true figure and so be able readily to calculate the lengths corresponding to the fractions between the half degrees. It should be well noted that, by these same theorems now before us, if we should suspect an error in the computation of any of the chords in the table, b we can easily make a test and

^a As there are 360 half degrees in the table, the statement appears to mean that the table occupied eight pages each of 45 rows; so Manitius, *Des Claudius Ptolemäus Handbuch der Astronomie*, 1er Bd., p. 35 n. a.

b Such an error might be accumulated by using the approximations for 1° and ½°; but, in fact, the sines in the

table are generally correct to five places of decimals.

ἐπανόρθωσιν ήτοι ἀπὸ τῆς ὑπὸ τὴν διπλασίονα τῆς ἐπιζητουμένης ἢ τῆς πρὸς ἄλλας τινὰς τῶν δεδομένων ὑπεροχῆς ἢ τῆς τὴν λείπουσαν εἰς τὸ ἡμικύκλιον περιφέρειαν ὑποτεινούσης εὐθείας. καί ἐστιν ἡ τοῦ κανονίου καταγραφὴ τοιαύτη.

ια'. Κανόνιον τῶν ἐν κύκλω εὐθειῶν

(c) MENELAUS'S THEOREM

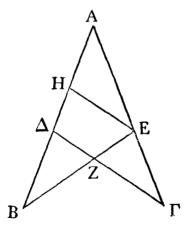

(i.) Lemmas

Ibid. 68, 14-74, 8

13. Preliminary matter for the spherical proofs

The next subject for investigation being to show the lengths of the arcs, intercepted between the celestial equator and the zodiac circle, of great circles drawn through the poles of the equator, we shall set out some brief and serviceable little lemmas, by means of which we shall be able to prove more simply and more systematically most of the questions investigated spherically.

Let two straight lines BE and I'A be drawn so as

to meet the straight lines AB and A Γ and to cut one

κατὰ τὸ Z σημεῖον. λέγω, ὅτι ὁ τῆς ΓA πρὸς A E λόγος συνῆπται ἔκ τε τοῦ τῆς $\Gamma \Delta$ πρὸς ΔZ καὶ τοῦ τῆς Z B πρὸς B E.

"Ηχθω γὰρ διὰ τοῦ Ε τῆ ΓΔ παράλληλος ἡ ΕΗ. ἐπεὶ παράλληλοί εἰσιν αἱ ΓΔ καὶ ΕΗ, ὁ τῆς ΓΑ πρὸς ΕΑ λόγος ὁ αὐτός ἐστιν τῷ τῆς ΓΔ πρὸς ΕΗ. ἔξωθεν δὲ ἡ ΖΔ· ὁ ἄρα τῆς ΓΔ πρὸς ΕΗ λόγος συγκείμενος ἔσται ἔκ τε τοῦ τῆς ΓΔ πρὸς ΔΖ καὶ τοῦ τῆς ΔΖ πρὸς ΗΕ· ὥστε καὶ ὁ τῆς ΓΑ πρὸς ΔΖ καὶ τοῦ τῆς ΔΖ πρὸς ΗΕ. ἔστιν δὲ καὶ ὁ τῆς ΔΖ πρὸς ΔΖ καὶ τοῦ τῆς ΔΖ πρὸς ΗΕ. ἔστιν δὲ καὶ ὁ τῆς ΔΖ πρὸς ΗΕ λόγος ὁ αὐτὸς τῷ τῆς ΖΒ πρὸς ΒΕ διὰ τὸ παραλλήλους πάλιν εἶναι τὰς ΕΗ καὶ ΖΔ· ὁ ἄρα τῆς ΓΑ πρὸς ΑΕ λόγος σύγκειται ἔκ τε τοῦ τῆς ΓΔ πρὸς ΔΖ καὶ τοῦ τῆς ΖΒ πρὸς ΒΕ· ὅπερ προέκειτο δεῖξαι.

Κατὰ τὰ αὐτὰ δὲ δειχθήσεται, ὅτι καὶ κατὰ διαίρεσιν ὁ τῆς ΓΕ πρὸς ΕΑ λόγος συνῆπται ἔκ τε τοῦ τῆς ΓΖ πρὸς ΔΖ καὶ τοῦ τῆς ΔΒ πρὸς ΒΑ, διὰ τοῦ Α τῆ ΕΒ παραλλήλου ἀχθείσης καὶ

 $^{^{\}alpha}$ Lit. "the ratio of ΓA to AE is compounded of the ratio of $\Gamma \Delta$ to ΔZ and ZB to BE ."

another at the point Z. I say that

$$\Gamma A : AE = (\Gamma \Delta : \Delta Z)(ZB : BE).^a$$

For through E let EH be drawn parallel to $\Gamma\Delta$. Since $\Gamma\Delta$ and EH are parallel,

 $\Gamma A : EA = \Gamma \Delta : EH$. [Eucl. vi. 4]

But Z∆ is an external [straight line];

$$\Gamma \Delta : EH = (\Gamma \Delta : \Delta Z)(\Delta Z : HE) ;$$

$$\cdot \cdot \cdot \qquad \Gamma A : AE = (\Gamma \Delta : \Delta Z)(\Delta Z : HE).$$

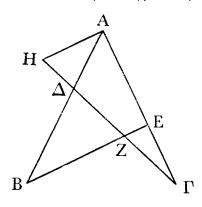

But $\Delta Z \in HE = ZB : BE$, [Eucl. vi. 4]

by reason of the fact that EH and $Z\Delta$ are parallels ;

..
$$\Gamma A : AE = (\Gamma \Delta : \Delta Z)(ZB : BE)$$
; (1) which was set to be proved.

With the same premises, it will be shown by transformation of ratios that

$$\Gamma E : EA = (\Gamma Z : \Delta Z)(\Delta B : BA),$$

a parallel to EB being drawn through A and ΓΔH
vol. II 2 G 449

προσεκβληθείσης έπ' αὐτὴν τῆς ΓΔΗ. ἐπεὶ γὰρ πάλιν παράλληλός έστιν ή ΑΗ τη ΕΖ, έστιν, ώς ή ΓΕ πρὸς ΕΑ, ή ΓΖ πρὸς ΖΗ. ἀλλὰ τῆς ΖΔ έξωθεν λαμβανομένης ὁ τῆς ΓΖ πρὸς ΖΗ λόγος σύγκειται έκ τε τοῦ τῆς ΓΖ πρὸς ΖΔ καὶ τοῦ τῆς ΔΖ πρὸς ΖΗ · ἔστιν δὲ ὁ τῆς ΔΖ πρὸς ΖΗ λόγος ό αὐτὸς τῶ τῆς ΔΒ πρὸς ΒΑ διὰ τὸ εἰς παραλλήλους τὰς ΑΗ καὶ ΖΒ διῆχθαι τὰς ΒΑ καὶ ΖΗ. ό ἄρα τῆς ΓΖ πρὸς ΖΗ λόγος συνῆπται ἔκ τε τοῦ τῆς ΓΖ πρὸς ΔΖ καὶ τοῦ τῆς ΔΒ πρὸς ΒΑ. άλλὰ τῷ τῆς ΓΖ πρὸς ΖΗ λόγω ὁ αὐτός ἐστιν ὁ της ΓΕ πρός ΕΑ· καὶ δ της ΓΕ ἄρα πρός ΕΑ λόγος σύγκειται έκ τε τοῦ τῆς ΓΖ πρὸς ΔΖ καὶ τοῦ τῆς ΔΒ πρὸς ΒΑ· ὅπερ ἔδει δείξαι.

Πάλιν έστω κύκλος ο ΑΒΓ, οὖ κέντρον τὸ Δ, καὶ εἰλήφθω ἐπὶ τὰς περιφερείας αὐτοῦ τυχόντα 450

being produced to it. For, again, since AH is parallel to EZ.

$$\Gamma E : EA = \Gamma Z : ZH.$$
 [Eucl. vi. 2

But, an external straight line Z having been taken,

$$\Gamma Z : ZH = (\Gamma Z : Z\Delta)(\Delta Z : ZH)$$
;

and
$$\Delta Z : ZH = \Delta B : BA$$
,

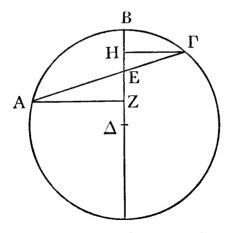

by reason of BA and ZH being drawn to meet the parallels AH and ZB;

$$\Gamma Z : ZH = (\Gamma Z : \Delta Z)(\Delta B : BA).$$

But
$$\Gamma Z : ZH = \Gamma E : EA ;$$
 [supra and :. $\Gamma E : EA = (\Gamma Z : \Delta Z)(\Delta B : BA) ;$. (2)

which was to be proved.

Again, let $AB\overline{\Gamma}$ be a circle with centre Δ , and let

there be taken on its circumference any three points

τρία σημεῖα τὰ A, B, Γ, ὥστε ἐκατέραν τῶν AB, BΓ περιφερειῶν ἐλάσσονα εἶναι ἡμικυκλίου· καὶ ἐπὶ τῶν ἑξῆς δὲ λαμβανομένων περιφερειῶν τὸ ὅμοιον ὑπακουέσθω· καὶ ἐπεζεύχθωσαν αἱ ΑΓ καὶ ΔΕΒ. λέγω, ὅτι ἐστίν, ὡς ἡ ὑπὸ τὴν διπλῆν τῆς AB περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΒΓ, οὕτως ἡ ΑΕ εὐθεῖα πρὸς τὴν ΕΓ εὐθεῖαν.

"Ηχθωσαν γὰρ κάθετοι ἀπὸ τῶν Α καὶ Γ σημείων ἐπὶ τὴν ΔΒ ἥ τε ΑΖ καὶ ἡ ΓΗ. ἐπεὶ παράλληλός ἐστιν ἡ ΑΖ τῷ ΓΗ, καὶ διῆκται εἰς αὐτὰς εὐθεῖα ἡ ΑΕΓ, ἔστιν, ὡς ἡ ΑΖ πρὸς τὴν ΓΗ, οὕτως ἡ ΑΕ πρὸς ΕΓ. ἀλλ' ὁ αὐτός ἐστιν λόγος ὁ τῆς ΑΖ πρὸς ΓΗ καὶ τῆς ὑπὸ τὴν διπλῆν τῆς ΑΒ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΒΓ· ἡμίσεια γὰρ ἐκατέρα ἐκατέρας· καὶ ὁ τῆς ΑΕ ἄρα πρὸς ΕΓ λόγος ὁ αὐτός ἐστιν τῷ τῆς ὑπὸ τὴν διπλῆν τῆς ΒΓ· ὅπερ ἔδει δεῖξαι.

Παρακολουθεῖ δ' αὐτόθεν, ὅτι, κἂν δοθῶσιν ἥ τε ΑΓ ὅλη περιφέρεια καὶ ὁ λόγος ὁ τῆς ὑπὸ τὴν διπλῆν τῆς ΒΓ, δοθήσεται καὶ ἐκατέρα τῶν ΑΒ καὶ ΒΓ περιφέρειῶν. ἐκτεθείσης γὰρ τῆς αὐτῆς καταγραφῆς ἐπεζεύχθω ἡ ΑΔ, καὶ ἤχθω ἀπὸ τοῦ Δ κάθετος ἐπὶ τὴν ΑΕΓ ἡ ΔΖ. ὅτι μὲν οὖν τῆς ΑΓ περι-452

A, B, Γ , in such a manner that each of the arcs AB, B Γ is less than a semicircle; and upon the arcs taken in succession let there be a similar relationship; and let A Γ be joined and Δ EB. I say that

the chord subtended by double of the arc AB: the chord subtended by double of the arc B Γ

[i.e., $\sin AB : \sin B\Gamma^a$] = $AE : E\Gamma$.

For let perpendiculars AZ and ΓH be drawn from the points A and Γ to ΔB . Since AZ is parallel to ΓH , and the straight line AE Γ has been drawn to meet them,

 $AZ : \Gamma H = AE : E\Gamma$. [Eucl. vi. 4]

But AZ: ΓH = the chord subtended by double of the arc AB:

the chord subtended by double of the arc $B\Gamma$,

for each term is half of the corresponding term; and therefore

 $AE: E\Gamma = the \ chord \ subtended \ by \ double \ of \ the \ arc \ AB:$

the chord subtended by double of the arc BF. (3)

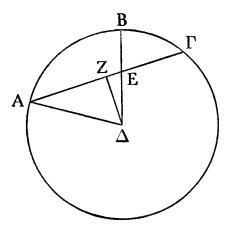

the arc B Γ . . . (3) $[=\sin AB : \sin B\Gamma],$

which was to be proved.

It follows immediately that, if the whole arc A Γ be given, and the ratio of the chord subtended by double of the arc AB to the chord subtended by double of the arc B Γ [i.e. sin AB: sin B Γ], each of the arcs AB and B Γ will also be given. For let the same diagram be set out, and let A Δ be joined, and from Δ let Δ Z be drawn perpendicular to Δ E Γ . If the arc

^{*} v. supra, p. 420 n. a.

φερείας δοθείσης ή τε ύπὸ ΑΔΖ γωνία τὴν ἡμίσειαν αὐτῆς ὑποτείνουσα δεδομένη ἔσται καὶ ὄλον τὸ ΑΔΖ τρίγωνον, δῆλον ἐπεὶ δὲ τῆς ΑΓ

εὐθείας ὅλης δεδομένης ὑπόκειται καὶ ὁ τῆς ΑΕ πρὸς ΕΓ λόγος ὁ αὐτὸς ὢν τῷ τῆς ὑπὸ τὴν διπλῆν τῆς ΑΒ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΒΓ, ἤ τε ΑΕ έσται δοθείσα καὶ λοιπή ή ΖΕ. καὶ διὰ τοῦτο καὶ τῆς ΔΖ δεδομένης δοθήσεται καὶ ή τε ὑπὸ ΕΔΖ γωνία τοῦ ΕΔΖ ὀρθογωνίου καὶ ὅλη ἡ ὑπὸ ΑΔΒ· ὥστε καὶ ἥ τε ΑΒ περιφέρεια δοθήσεται καὶ λοιπὴ ἡ ΒΓ· ὅπερ ἔδει δεῖξαί.

Πάλιν ἔστω κύκλος δ ΑΒΓ περὶ κέντρον τὸ Δ, καὶ ἐπὶ τῆς περιφερείας αὐτοῦ εἰλήφθω τρία σημεῖα τὰ A, B, Γ, ὥστε ἐκατέραν τῶν AB, ΑΓ περιφερειών ελάσσονα είναι ήμικυκλίου καὶ έπὶ

454

A Γ is given, it is then clear that the angle A ΔZ , subtending half the same arc, will also be given and therefore the whole triangle A ΔZ ; and since the whole chord A Γ is given, and by hypothesis

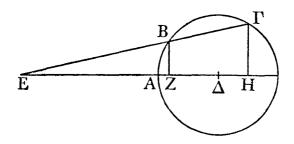

AE: $E\Gamma$ = the chord subtended by double of the arc AB:

the chord subtended by double of the arc $B\Gamma$,

[i.e. = $\sin AB : \sin B\Gamma$],

therefore AE will be given [Eucl. Dat. 7], and the remainder ZE. And for this reason, ΔZ also being given, the angle $E\Delta Z$ will be given in the right-angled triangle $E\Delta Z$, and [therefore] the whole angle $A\Delta B$; therefore the arc AB will be given and also the remainder $B\Gamma$; which was to be proved.

Again, let AB Γ be a circle about centre \triangle , and let

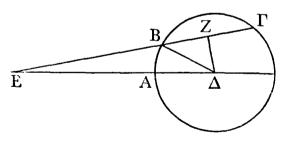

three points A. B, Γ be taken on its circumference so that each of the arcs AB, A Γ is less than a semicircle;

των έξης δε λαμβανομένων περιφερειών το δμοιον ύπακουέσθω καὶ ἐπιζευχθεῖσαι ή τε ΔΑ καὶ ή ΓΒ εκβεβλήσθωσαν καὶ συμπιπτέτωσαν κατὰ τὸ Ε σημεῖον. λέγω, ὅτι ἐστίν, ὡς ἡ ὑπὸ τὴν διπλῆν τῆς ΓΑ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΑΒ, ούτως ή ΓΕ εὐθεῖα πρὸς την ΒΕ.

'Ομοίως γάρ τῷ προτέρω λημματίω, ἐὰν ἀπὸ τῶν Β καὶ Γ ἀγάγωμεν καθέτους ἐπὶ τὴν ΔΑ τήν τε ΒΖ καὶ τὴν ΓΗ, ἔσται διὰ τὸ παραλλήλους αὐτὰς εἶναι, ὡς ἡ ΓΗ πρὸς τὴν ΒΖ, οὕτως ἡ ΓΕ πρός την ΕΒ. ωστε καί, ως ή ύπο την διπλην της ΓΑ πρός τὴν ὑπὸ τὴν διπλῆν τῆς ΑΒ, οὕτως ἡ ΓΕ πρὸς τὴν ΕΒ· ὅπερ ἔδει δεῖξαι. Καὶ ἐνταῦθα δὲ αὐτόθεν παρακολουθεῖ, διότι,

καν ή ΓΒ περιφέρεια μόνη δοθή, και ο λόγος ο της ύπο την διπλην της ΓΑ προς την ύπο την λης οπο την οιπτην της ΤΑ προς την υπο την διπλην της ΑΒ δοθη, καὶ ή ΑΒ περιφέρεια δοθήσεται. πάλιν γὰρ ἐπὶ της όμοίας καταγραφης ἐπιζευχθείσης της ΔΒ καὶ καθέτου ἀχθείσης ἐπὶ

την ΒΓ της ΔΖ η μεν ύπο ΒΔΖ γωνία την ημίσσειαν ύποτείνουσα της ΒΓ περιφερείας έσται 456

and upon the arcs taken in succession let there be a similar relationship; and let ΔA be joined and let ΓB be produced so as to meet it at the point E. I say that

the chord subtended by double of the arc ΓA : the chord subtended by double of the arc AB

[i.e., $\sin \Gamma A : \sin AB$] = $\Gamma E : BE$.

For, as in the previous lemma, if from B and Γ we draw BZ and Γ II perpendicular to Δ A, then, by reason of the fact that they are parallel,

$$\Gamma H : BZ = \Gamma E : EB$$
. [Eucl. vi. 4

:. the chord subtended by double of the arc ΓA : the chord subtended by double of the arc AB

[i.e.,
$$\sin \Gamma A : \sin AB$$
] = $\Gamma E : EB$; . (4) which was to be proved.

And thence it immediately follows why, if the arc ΓB alone be given, and the ratio of the chord subtended by double of the arc ΓA to the chord subtended by double of the arc AB [i.e., $\sin \Gamma A$: $\sin AB$], the arc AB will also be given. For again, in a similar diagram let ΔB be joined and let ΔZ be drawn perpendicular to $B\Gamma$; then the angle $B\Delta Z$ subtended by half the arc $B\Gamma$ will be given; and therefore the

δεδομένη· καὶ ὅλον ἄρα τὸ ΒΔΖ ὀρθογώνιον. ἐπεὶ δὲ καὶ ὅ τε τῆς ΓΕ πρὸς τὴν ΕΒ λόγος δέδοται καὶ ἔτι ἡ ΓΒ εὐθεῖα, δοθήσεται καὶ ἥ τε ΕΒ καὶ ἔτι ὅλη ἡ ΕΒΖ· ὥστε καὶ, ἐπεὶ ἡ ΔΖ δέδοται, δοθήσεται καὶ ἥ τε ὑπὸ ΕΔΖ γωνία τοῦ αὐτοῦ ὀρθογωνίου καὶ λοιπὴ ἡ ὑπὸ ΕΔΒ. ὥστε καὶ ἡ ΑΒ περιφέρεια ἔσται δεδομένη.

(ii.) The Theorem

Ibid, 71, 9-76, 9

Τούτων προληφθέντων γεγράφθωσαν έπὶ σφαιρικῆς ἐπιφανείας μεγίστων κύκλων περιφέρειαι, ώστε εἰς δύο τὰς ΑΒ καὶ ΑΓ δύο γραφείσας τὰς ΒΕ καὶ ΓΔ τέμνειν ἀλλήλας κατὰ τὸ Z σημεῖον ἔστω δὲ ἑκάστη αὐτῶν ἐλάσσων ἡμικυκλίου τὸ δὲ αὐτὸ καὶ ἐπὶ πασῶν τῶν καταγραφῶν ὑπακουέσθω.

Λέγω δή, ὅτι ὁ τῆς ὑπὸ τὴν διπλῆν τῆς ΓΕ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΕΑ λόγος συνῆπται ἔκ τε τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΓΖ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΖΔ καὶ τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΑΒ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΒΑ.

Εἰλήφθω γὰρ τὸ κέντρον τῆς σφαίρας καὶ ἔστω τὸ Η, καὶ ἤχθωσαν ἀπὸ τοῦ Η ἐπὶ τὰς Β, Ζ, Ε τομὰς τῶν κύκλων ἤ τε ΗΒ καὶ ἡ ΗΖ καὶ ἡ ΗΕ, καὶ ἐπιζευχθεῖσα ἡ ΑΔ ἐκβεβλήσθω καὶ συμπιπτέτω τῆ ΗΒ ἐκβληθείση καὶ αὐτῆ κατὰ τὸ Θ σημεῖον, ὁμοίως δὲ ἐπιζευχθεῖσαι αἱ ΔΓ καὶ ΑΓ τεμνέτωσαν τὰς ΗΖ καὶ ΗΕ κατὰ τὸ Κ καὶ Λ 458

TRIGONOMETRY

whole of the right-angled triangle $B\Delta Z$. But since the ratio ΓE : EB is given and also the chord ΓB , therefore EB will also be given and, further, the whole [straight line] EBZ; therefore, since ΔZ is given, the angle $E\Delta Z$ in the same right-angled triangle will be given, and the remainder $E\Delta B$. Therefore the arc AB will be given.

(ii.) The Theorem Ibid. 74. 9-76. 9

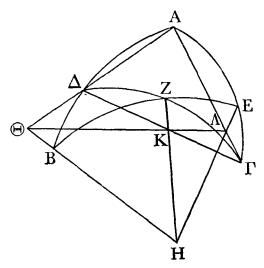

These things having first been grasped, let there be described on the surface of a sphere arcs of great circles such that the two arcs BE and $\Gamma\Delta$ will meet the two arcs AB and A Γ and will cut one another at the point Z; let each of them be less than a semi-circle; and let this hold for all the diagrams.

Now I say that the ratio of the chord subtended by double of the arc ΓE to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc ΓZ to the chord subtended by double of the arc $Z\Delta$, and (b) the ratio of the chord subtended by double of the arc ΔB to the chord subtended by double of the arc BA,

$$\left[i.e., \frac{\sin \Gamma E}{\sin EA} = \frac{\sin \Gamma Z}{\sin Z\Delta} \cdot \frac{\sin \Delta B}{\sin BA}\right].$$

For let the centre of the sphere be taken, and let it be H, and from H let HB and HZ and HE be drawn to B, Z, E, the points of intersection of the circles, and let $A\Delta$ be joined and produced, and let it meet HB produced at the point Θ , and similarly let $\Delta\Gamma$ and $A\Gamma$ be joined and cut HZ and HE at K and the point

σημεῖον επὶ μιᾶς δὴ γίνεται εὐθείας τὰ Θ, Κ, Λ σημεῖα διὰ τὸ εν δυσὶν ἄμα εἶναι επιπέδοις τῷ τε τοῦ $A\Gamma\Delta$ τριγώνου καὶ τῷ τοῦ BZE κύκλου, ἥτις

ἐπιζευχθεῖσα ποιεῖ εἰς δύο εὐθείας τὰς ΘΑ καὶ ΓΑ διηγμένας τὰς ΘΛ καὶ ΓΔ τεμνούσας ἀλλήλας κατὰ τὸ Κ σημεῖον· ὁ ἄρα τῆς ΓΛ πρὸς ΛΑ λόγος συνῆπται ἔκ τε τοῦ τῆς ΓΚ πρὸς ΚΔ καὶ τοῦ τῆς ΔΘ πρὸς ΘΑ. ἀλλ' ὡς μὲν ἡ ΓΛ πρὸς ΛΑ, οὕτως ἡ ὑπὸ τὴν διπλῆν τῆς ΓΕ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓΕ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓΖ περιφερείας ΚΔ, οὕτως ἡ ὑπὸ τὴν διπλῆν τῆς ΓΖ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓΖ περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΖΔ, ὡς δὲ ἡ ΘΔ 460

TRIGONOMETRY

 Λ ; then the points Θ , K, Λ will lie on one straight line because they lie simultaneously in two planes, that of the triangle $A\Gamma\Delta$ and that of the circle BZE, and therefore we have straight lines $\Theta\Lambda$ and $\Gamma\Delta$ meeting the two straight lines $\Theta\Lambda$ and $\Gamma\Lambda$ and cutting one another at the point K; therefore

$$\Gamma\Lambda : \Lambda\Lambda = (\Gamma K : K\Delta)(\Delta\Theta : \Theta\Lambda).$$
 [by (2)

But $\Gamma\Lambda: \Lambda A =$ the chord subtended by double of the arc $\Gamma E:$

the chord subtended by double of the arc EA

[i.e., $\sin \Gamma E : \sin EA$],

while $\Gamma K : K\Delta =$ the chord subtended by double of the arc $\Gamma Z :$

the chord subtended by double of
the arc Z\(\Delta\) [by (3)

[i.e., $\sin \Gamma Z : \sin Z \Delta$],

461

πρὸς ΘΑ, οὕτως ἡ ὑπὸ τὴν διπλῆν τῆς ΔB περιφερείας πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς BA· καὶ ὁ λόγος ἄρα ὁ τῆς ὑπὸ τὴν διπλῆν τῆς ΓE πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς EA συνῆπται ἔκ τε τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΓZ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓZ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓZ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΓZ καὶ τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΓZ καὶ τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΓZ

Κατὰ τὰ αὐτὰ δὴ καὶ ὥσπερ ἐπὶ τῆς ἐπιπέδου καταγραφῆς τῶν εὐθειῶν δείκνυται, ὅτι καὶ ὁ τῆς ὑπὸ τὴν διπλῆν τῆς ΓΑ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΕΑ λόγος συνῆπται ἔκ τε τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς ΓΔ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΔΖ καὶ τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς δΕ καὶ τοῦ τῆς ὑπὸ τὴν διπλῆν τῆς δΕ πρὸς τὴν ὑπὸ τὴν διπλῆν τῆς ΒΕ· ἄπερ προέκειτο δεῖξαι.

^a From the Arabic version, it is known that "Menelaus's Theorem" was the first proposition in Book iii. of his *Sphaerica*, and several interesting deductions follow.

TRIGONOMETRY

and $\Theta \Delta : \Theta A =$ the chord subtended by double of the arc ΔB :

the chord subtended by double of the arc BA [by (4) -

[i.e., $\sin \Delta B : \sin BA$],

and therefore the ratio of the chord subtended by double of the arc ΓE to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc ΓZ to the chord subtended by double of the arc $Z\Delta$, and (b) the ratio of the chord subtended by double of the arc ΔB to the chord subtended by double of the arc BA,

$$\left[i.e., \frac{\sin \Gamma E}{\sin EA} = \frac{\sin \Gamma Z}{\sin Z\Delta} \cdot \frac{\sin \Delta B}{\sin BA}\right].$$

Now with the same premises, and as in the case of the straight lines in the plane diagram [by (1)], it is shown that the ratio of the chord subtended by double of the arc Γ A to the chord subtended by double of the arc EA is compounded of (a) the ratio of the chord subtended by double of the arc Γ A to the chord subtended by double of the arc Δ Z, and (b) the ratio of the chord subtended by double of the arc ZB to the chord subtended by double of the chord BE,

[i.e.,
$$\frac{\sin \Gamma A}{\sin E A} = \frac{\sin \Gamma \Delta}{\sin \Delta Z} \cdot \frac{\sin ZB}{\sin BE}$$
];

which was set to be proved.a

(a) Definitions

Heron, Deff., ed. Heiberg (Heron iv.) 14. 1-24

Καὶ τὰ μὲν πρὸ τῆς γεωμετρικῆς στοιχειώσεως τεχνολογούμενα ὑπογράφων σοι καὶ ὑποτυπούμενος, ὡς ἔχει μάλιστα συντόμως, Διονύσιε λαμπρότατε, τήν τε ἀρχὴν καὶ τὴν ὅλην σύνταξιν ποιήσομαι κατὰ τὴν τοῦ Εὐκλείδου τοῦ Στοιχειωτοῦ τῆς ἐν γεωμετρία θεωρίας διδασκαλίαν οἷμαι γὰρ οὕτως οὐ μόνον τὰς ἐκείνου πραγματείας

The chief works of Heron are now definitively published in five volumes of the Teubner series. Perhaps the best known are his *Pneumatica* and the *Jutomata*, in which he shows how to use the force of compressed air, water or steam; they are of great interest in the history of physics, and have led some to describe Heron as "the father of the turbine," but

[&]quot;The problem of Heron's date is one of the most disputed questions in the history of Greek mathematics. The only details certainly known are that he lived after Apollonius, whom he quotes, and before Pappus, who cites him, say between 150 B.c. and A.D. 250. Many scraps of evidence have been thrown into the dispute, including the passage here first cited; for it is argued that the title $\lambda a \mu \pi \rho \delta \tau a \tau o$ corresponds to the Latin clarissimus, which was not in common use in the third century A.D. Both Heiberg (Heron, vol. v. p. ix) and Heath (H.G.M. ii. 306) place him, however, in the third century A.D., only a little earlier than Pappus.

XXII. MENSURATION: HERON OF ALEXANDRIA ^a

(a) Definitions

Heron, Definitions, ed. Heiberg (Heron iv.) 14. 1-24

In setting out for you as briefly as possible, O most excellent Dionysius, a sketch of the technical terms premised in the elements of geometry, I shall take as my starting point, and shall base my whole arrangement upon, the teaching of Euclid, the writer of the elements of theoretical geometry; for in this way I think I shall give you a good general understanding,

as they have no mathematical interest they cannot be noticed here. Heron also wrote a *Belopoeica* on the construction of engines of war, and a *Mechanics*, which has survived in Arabic and in a few fragments of the Greek.

In geometry, Heron's elaborate collection of Definitions has survived, but his Commentary on Euclid's Elements is known only from extracts preserved by Proclus and an-Nairīzī, the Arabic commentator. In mensuration there are extant the Metrica, Geometrica, Stereometrica, Geodaesia, Mensurae and Liber Geiponicus. The Metrica, discovered in a Constantinople Ms. in 1896 by R. Schöne and edited by his son H. Schöne, seems to have preserved its original form more closely than the others, and will be relied on here in preference to them. Heron's Dioptra, describing an instrument of the nature of a theodolite and its application to surveying, is also extant and will be cited here.

For a full list of Heron's many works, v. Heath, H.G.M.

^a The first definition is that of Euclid i. Def. 1, the third in effect that of Plato, who defined a point as $d\rho\chi\dot{\eta}$ $\gamma\rho a\mu\mu\dot{\eta}s$ (Aristot. *Metaph.* 992 a 20); the second is reminiscent of Nicomachus, *Arith. Introd.* ii. 7. 1, v. vol. i. pp. 86-89.

not only of Euclid's works, but of many others pertaining to geometry. I shall begin, then, with the point.

1. A point is that which has no parts, or an extremity without extension, or the extremity of a line, a and, being both without parts and without magnitude, it can be grasped by the understanding only. said to have the same character as the moment in time or the unit having position.^b It is the same as the unit in its fundamental nature, for they are both indivisible and incorporeal and without parts, but in relation to surface and position they differ; for the unit is the beginning of number, while the point is the beginning of geometrical being-but a beginning by way of setting out only, not as a part of a line, in the way that the unit is a part of number-and is prior to geometrical being in conception; for when a point moves, or rather is conceived in motion, a line is conceived, and in this way a point is the beginning of a line and a surface is the beginning of a solid body.

Ibid. 60. 22-62. 9

- 97. A spire is generated when a circle revolves and returns to its original position in such a manner that its centre traces a circle, the original circle remaining at right angles to the plane of this circle; this same curve is also called a ring. A spire is open when there is a gap, continuous when it touches at one point, and self-crossing when the revolving circle cuts itself.
- ^b The Pythagorean definition of a point: v. Proclus, in Eucl. i., ed. Friedlein 95. 22. Proclus's whole comment is worth reading, and among modern writers there is a full discussion in Heath, The Thirteen Books of Euclid's Elements, vol. i. pp. 155-158.

αὐτὸς αὐτὸν τέμνει. γίνονται δὲ καὶ τούτων τομαὶ γραμμαί τινες ἰδιάζουσαι. οἱ δὲ τετράγωνοι κρίκοι ἐκπρίσματά εἰσι κυλίνδρων· γίνονται δὲ καὶ ἄλλα τινὰ ποικίλα πρίσματα ἔκ τε σφαιρῶν καὶ ἐκ μικτῶν ἐπιφανειῶν.

Certain special curves are generated by sections of these spires. But the *square rings* are prismatic sections of cylinders; various other kinds of prismatic sections are formed from spheres and *mixed* surfaces.^a

(b) Measurement of Areas and Volumes

(i.) Area of a Triangle Given the Sides

Heron, Metrica i. 8, ed. H. Schöne (Heron iii.) 18. 12-24. 21

There is a general method for finding, without drawing a perpendicular, the area of any triangle whose three sides are given. For example, let the sides of the triangle be 7, 8 and 9. Add together 7, 8 and 9; the result is 24. Take half of this, which gives 12. Take away 7; the remainder is 5. Again, from 12 take away 8; the remainder is 4. And again 9; the remainder is 3. Multiply 12 by 5; the result is 60. Multiply this by 4; the result is 240. Multiply this by 3; the result is 720. Take the square root of this and it will be the area of the triangle. Since 720 has not a rational square root, we shall make a close approximation to the root in this manner. Since the square nearest to 720 is 729, having a root 27, divide 27 into 720; the result is $26\frac{2}{3}$; add 27; the result is $53\frac{2}{3}$. Take half of this; the result is $26\frac{1}{2} + \frac{1}{3} (=26\frac{5}{6})$. Therefore the square root of 720 will be very nearly $26\frac{5}{6}$. For $26\frac{5}{6}$ multiplied by itself gives $720\frac{1}{36}$; so that the difference is $\frac{1}{36}$. If we wish to make the difference less than $\frac{1}{36}$,

^a The passage should be read in conjunction with those from Proclus cited *supra*, pp. 360-365; note the slight difference in terminology—self-crossing for interlaced.

έν έλάσσονι μορίω τοῦ λε΄ τὴν διαφοράν γίγνεσθαι. άντὶ τοῦ ψκθ τάξομεν τὰ νῦν εύρεθέντα ψκ καὶ λ5', καὶ ταὐτὰ ποιήσαντες εύρήσομεν πολλῶ ἐλάττονα (τοῦ) λε΄ την διαφοράν γιγνομένην.

'Η δε γεωμετρική τούτου απόδειξίς εστιν ήδε. τριγώνου δοθεισῶν τῶν πλευρῶν εύρεῖν τὸ ἐμβαδόν. δυνατόν μέν οὖν έστιν ἀγαγόντα[ς]² μίαν κάθετον καὶ πορισάμενον αὐτῆς τὸ μέγεθος εύρεῖν τοῦ τριγώνου τὸ ἐμβαδόν, δέον δὲ ἔστω χωρὶς τῆς καθέτου τὸ ἐμβαδὸν πορίσασθαι.

"Εστω τὸ δοθὲν τρίγωνον τὸ ΑΒΓ καὶ ἔστω έκάστη τῶν ΑΒ, ΒΓ, ΓΑ δοθεῖσα εὐρεῖν τὸ ἐμβα-

> 1 τοῦ add. Heiberg. ² aγαγόντα[s] corr. H. Schöne.

$$a_1 = \frac{1}{2} \left(a + \frac{A}{a} \right)$$

and as a second approximation,

$$a_2 = \frac{1}{2} \left(a_1 + \frac{A}{a_1} \right)$$
.

An equivalent formula is used by Rhabdas (v. vol. i. p. 30 n. b) and by a fourteenth century Calabrian monk Barlaam, who wrote in Greek and who indicated that the process could be continued indefinitely. Several modern writers have used the formula to account for Archimedes' approximations to $\sqrt{3}$ (v. vol. i. p. 322 n. a).

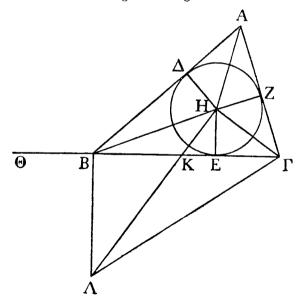

b Heron had previously shown how to do this.

^a If a non-square number A is equal to $a^2 \pm b$, Heron's method gives as a first approximation to \sqrt{A} .

instead of 729 we shall take the number now found, $720\frac{1}{36}$, and by the same method we shall find an approximation differing by much less than $\frac{1}{36}$.

The geometrical proof of this is as follows: In a triangle whose sides are given to find the area. Now it is possible to find the area of the triangle by drawing one perpendicular and calculating its magnitude, but let it be required to calculate the area without the perpendicular.

Let $\hat{A}B\Gamma$ be the given triangle, and let each of

AB, B Γ , Γ A be given; to find the area. Let the

δόν. ἐγγεγράφθω εἰς τὸ τρίγωνον κύκλος ὁ ΔΕΖ, οῦ κέντρον ἔστω τὸ Η, καὶ ἐπεζεύχθωσαν αἱ ΑΗ, ΒΗ, ΓΗ, ΔΗ, ΕΗ, ΖΗ. τὸ μὲν ἄρα ὑπὸ ΒΓ, ΕΗ διπλάσιόν έστι τοῦ ΒΗΓ τριγώνου, τὸ δὲ ύπὸ ΓΑ, ΖΗ τοῦ ΑΓΗ τριγώνου, (τὸ δὲ ὑπὸ ΑΒ, ΔΗ τοῦ ΑΒΗ τριγώνου \rangle^1 . τὸ ἄρα ὑπὸ τῆς περιμέτρου τοῦ ΑΒΓ τριγώνου καὶ τῆς ΕΗ, τουτέστι τῆς ἐκ τοῦ κέντρου τοῦ ΔΕΖ κύκλου, διπλάσιόν έστι τοῦ ΑΒΓ τριγώνου. ἐκβεβλήσθω ή ΓΒ, καὶ τῆ $\rm A\Delta$ ἴση κείσθω ἡ $\rm B\Theta\cdot$ ἡ ἄρα $\rm \Gamma B\Theta$ ἡμίσειά ἐστι τῆς περιμέτρου τοῦ $AB\Gamma$ τριγώνου διὰ τὸ ἴσην εἶναι τὴν μὲν $A\Delta$ τῆ AZ, τὴν δὲ ΔB τῆ BE, τὴν δὲ ΖΓ τῆ ΓΕ. τὸ ἄρα ὑπὸ τῶν ΓΘ, ΕΗ ἴσον ἐστὶ τῷ ΑΒΓ τριγώνῳ. ἀλλὰ τὸ ὑπὸ τῶν ΓΘ, ΕΗ πλευρά ἐστιν τοῦ ἀπὸ τῆς $\Gamma\Theta$ ἐπὶ τὸ ἀπὸ τῆς EH· ἔσται ἄρα τοῦ $AB\Gamma$ τριγώνου τὸ ἐμβαδὸν ϵ φ' ϵ αυτὸ γενόμενον ἴσον τ $\hat{\varphi}$ ἀπὸ τ $\hat{\eta}$ ς Θ Γ ϵ πὶ τὸ ἀπὸ τ $\hat{\eta}$ ς EH. $\mathring{\eta}$ χ θ ω τ $\mathring{\eta}$ μ ϵ ν Γ H πρὸς ὀρθὰς $\mathring{\eta}$ HA, $\tau \hat{\eta}$ δè $\Gamma B \hat{\eta} \hat{B} \Lambda$, καὶ ἐπεζεύχθω $\hat{\eta} \Gamma \Lambda$. ἐπεὶ οὖν ὀρθή ἐστιν ἐκατέρα τῶν ὑπό ΓΗΛ, ΓΒΛ, ἐν κύκλω ἄρα ἐστὶ τὸ ΓΗΒΛ τετράπλευρον αἱ ἄρα ύπο ΓΗΒ, ΓΛΒ δυσίν δρθαίς είσιν ίσαι. είσιν δέ καὶ αἱ ὑπὸ ΓΗΒ, ΑΗΔ δυσὶν ὀρθαῖς ἴσαι διὰ τὸ δίχα τετμῆσθαι τὰς πρὸς τῷ Η γωνίας ταῖς ΑΗ, ΒΗ, ΓΗ καὶ ἴσας εἶναι τὰς ὑπὸ τῶν ΓΗΒ, ΑΗΔ ταις ύπο των ΑΗΓ, ΔΗΒ και τας πάσας τέτρασιν όρθαῖς ἴσας εἶναι· ἴση ἄρα ἐστὶν ἡ ὑπὸ $AH\Delta$ $\tau\hat{\eta}$ ύπὸ ΓΛΒ. ἔστι δὲ καὶ ὀρθὴ ἡ ὑπὸ ΑΔΗ ὀρθῆ τῆ ὑπὸ ΓΒΛ ἴση· ὅμοιον ἄρα ἐστὶ τὸ ΑΗΔ τρίγωνον τῶ ΓΒΛ τριγώνω, ὡς ἄρα ἡ ΒΓ πρὸς

¹ τὸ δὲ . . . τριγώνου: these words, along with several 474

circle Δ EZ be inscribed in the triangle with centre H [Eucl. iv. 4], and let AH, BH, Γ H, Δ H, EH, ZH be joined. Then

B Γ . EH = 2 . triangle BH Γ , [Eucl. i. 41 Γ A . ZH = 2 . triangle AH Γ , [ibid. AB . Δ H = 2 . triangle ABH. [ibid.

Therefore the rectangle contained by the perimeter of the triangle AB Γ and EH, that is the radius of the circle Δ EZ, is double of the triangle AB Γ . Let Γ B be produced and let B Θ be placed equal to A Δ ; then Γ B Θ is half of the perimeter of the triangle AB Γ because A Δ = AZ, Δ B = BE, Z Γ = Γ E [by Eucl. iii. 17]. Therefore

 $\Gamma\Theta$. EH = triangle AB Γ . [ibid. $\Gamma\Theta$. EH = $\sqrt{\Gamma\Theta^2$. EH 2 ;

therefore

But

(triangle AB Γ)²= $\Theta\Gamma^2$. EH².

Let $H\Lambda$ be drawn perpendicular to ΓH and $B\Lambda$ perpendicular to ΓB , and let $\Gamma \Lambda$ be joined. Then since each of the angles $\Gamma H\Lambda$, $\Gamma B\Lambda$ is right, a circle can be described about the quadrilateral $\Gamma HB\Lambda$ [by Eucl. iii. 31]; therefore the angles ΓHB , $\Gamma \Lambda B$ are together equal to two right angles [Eucl. iii. 22]. But the angles ΓHB , $AH\Delta$ are together equal to two right angles because the angles at H are bisected by AH, BH, ΓH and the angles ΓHB , $AH\Delta$ together with $AH\Gamma$, ΔHB are equal to four right angles; therefore the angle $A\Delta H$ is equal to the right angle $\Gamma B\Lambda$; therefore the triangle $AH\Delta$ is similar to the triangle $\Gamma B\Lambda$.

other obvious corrections not specified in this edition, were rightly added to the text by a fifteenth-century scribe.

 $B\Lambda$, $\dot{\eta}$ $A\Delta$ $\pi\rho\dot{o}s$ ΔH , $\tau o \nu \tau \dot{\epsilon} \sigma \tau \iota \nu$ $\dot{\eta}$ $B\Theta$ $\pi\rho\dot{o}s$ EH, καὶ ἐναλλάξ, ὡς ἡ ΓΒ πρὸς ΒΘ, ἡ ΒΛ πρὸς ΕΗ, τουτέστιν ή ΒΚ πρὸς ΚΕ διὰ τὸ παράλληλον είναι την ΒΛ τη ΕΗ, καὶ συνθέντι, ώς ή ΓΘ πρὸς ΒΘ, ούτως ή $\stackrel{\circ}{\rm BE}$ πρὸς $\stackrel{\circ}{\rm EK}$ · $\stackrel{\circ}{\omega}$ οτε καὶ ώς τὸ ἀπὸ τῆς $\stackrel{\circ}{\rm ΓΘ}$ πρὸς τὸ ὑπὸ τῶν $\stackrel{\circ}{\rm ΓΘ}$, $\stackrel{\circ}{\rm OB}$, οὕτως τὸ ὑπὸ ΒΕΓ πρός τὸ ὑπὸ ΓΕΚ, τουτέστι πρὸς τὸ ἀπὸ ΕΗ· ἐν ὀρθογωνίω γὰρ ἀπὸ τῆς ὀρθῆς ἐπὶ τὴν βάσιν κάθετος ἦκται ἡ ΕΗ· ὥστε τὸ ἀπὸ τῆς ΓΘ έπὶ τὸ ἀπὸ τῆς ΕΗ, οὖ πλευρὰ ἦν τὸ ἐμβαδὸν τοῦ ΑΒΓ τριγώνου, ἴσον ἔσται τῷ ὑπὸ ΓΘΒ ἐπὶ τὸ ὑπὸ ΓΕΒ. καὶ ἔστι δοθεῖσα ἐκάστη τῶν ΓΘ, ΘΒ, ΒΕ, ΓΕ· ή μὲν γὰρ ΓΘ ἡμίσειά ἐστι τῆς περιμέτρου τοῦ ΑΒΓ τριγώνου, ή δὲ ΒΘ ή ὑπεροχή, η ύπερέχει η ημίσεια της περιμέτρου της ΓΒ, ή δὲ ΒΕ ή ὑπεροχή, ἡ ὑπερέχει ἡ ἡμίσεια της περιμέτρου της ΑΓ, ή δε ΕΓ ή ύπεροχή, η ύπερέχει ή ημίσεια της περιμέτρου της ΑΒ, έπειδήπερ ἴση ἐστὶν ἡ μὲν ΕΓ τῆ ΓΖ, ἡ δὲ $B\Theta$ τῆ AZ, ἐπεὶ καὶ τῆ $A\Delta$ ἐστὶν ἴση. δοθὲν ἄρα καὶ το εμβαδον τοῦ ΑΒΓ τριγώνου.

(ii.) Volume of a Spire

Ibid. ii. 13, ed. H. Schöne (Heron iii.) 126. 10-130. 3

"Εστω γάρ τις ἐν ἐπιπέδω εὐθεῖα ἡ ΑΒ καὶ δύο τυχόντα ἐπ' αὐτῆς σημεῖα. εἰλήφθω ὁ ΒΓΔΕ (κύκλος) ὀρθὸς ὢν πρὸς τὸ ὑποκείμενον ἐπίπεδον, ἐν ῷ ἐστιν ἡ ΑΒ εὐθεῖα, καὶ μένοντος τοῦ Α

¹ κύκλος add. H. Schöne.

Therefore BI': $BA = A\Delta : \Delta H$

 $= B\Theta : EH,$

and permutando, $\Gamma B : B\Theta = B\Lambda : EH$

=BK:KE,

because BA is parallel to EH,

and componendo $\Gamma\Theta : B\Theta = BE : EK$;

therefore $\Gamma\Theta^2:\Gamma\Theta$. $\Theta B=BE$. $E\Gamma:\Gamma E$. EK,

i.e. $= BE \cdot E\Gamma : EH^2$,

for in a right-angled triangle EH has been drawn from the right angle perpendicular to the base; therefore $\Gamma\Theta^2$. EH², whose square root is the area of the triangle AB Γ , is equal to $(\Gamma\Theta$. Θ B)(Γ E. EB). And each of $\Gamma\Theta$, Θ B, BE, Γ E is given; for $\Gamma\Theta$ is half of the perimeter of the triangle AB Γ , while B Θ is the excess of half the perimeter over Γ B, BE is the excess of half the perimeter over Al', and E Γ is the excess of half the perimeter over AB, inasmuch as E Γ = Γ Z, B Θ = A Δ = AZ. Therefore the area of the triangle AB Γ is given.

(ii.) Volume of a Spire

Ibid. ii. 13, ed. H. Schöne (Heron iii.) 126. 10-130. 3

Let AB be any straight line in a plane and A, B any two points taken on it. Let the circle $B\Gamma\Delta E$ be taken perpendicular to the plane of the horizontal, in which lies the straight line AB, and, while the point

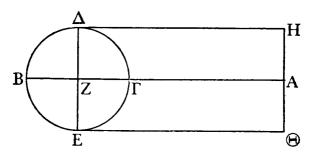

^a If the sides of the triangle are a, b, c, and $s = \frac{1}{2}(a+b+c)$, Heron's formula may be stated in the familiar terms,

area of triangle = $\sqrt{s(s-a)(s-b)(s-c)}$.

Heron also proves the formula in his *Dioptra* 30, but it is now known from Arabian sources to have been discovered by Archimedes.

σημείου περιφερέσθω κατὰ τὸ ἐπίπεδον ἡ AB, ἄχρι οὖ εἰς τὸ αὐτὸ ἀποκατασταθῆ συμπεριφερομένου καὶ τοῦ ΒΓΔΕ κύκλου ὀρθοῦ διαμένοντος πρὸς τὸ ὑποκείμενον ἐπίπεδον. ἀπογεννήσει ἄρα τινὰ ἐπιφάνειαν ἡ ΒΓΔΕ περιφέρεια, ῆν δὴ σπειρικὴν καλοῦσιν· κᾶν μὴ ἦ δὲ ὅλος ὁ κύκλος, ἀλλὰ τμῆμα αὐτοῦ, πάλιν ἀπογεννήσει τὸ τοῦ κύκλου τμῆμα σπειρικῆς ἐπιφανείας τμῆμα, καθάπερ εἰσὶ καὶ αἱ ταῖς κίοσιν ὑποκείμεναι σπεῖρὰι· τριῶν γὰρ οὐσῶν ἐπιφανειῶν ἐν τῷ καλουμένω ἀναγραφεῖ, δν δή τινες καὶ ἐμβολέσ καλοῦσιν, δύο μὲν κοίλων τῶν ἄκρων, μιᾶς δὲ μέσης καὶ κυρτῆς, ἄμα περιφερόμεναι αἱ τρεῖς ἀπογεννῶσι τὸ εἶδος τῆς τοῖς κίοσιν ὑποκειμένης σπείρας.

 Δ έον οὖν ἔστω τὴν ἀπογεννηθείσαν σπείραν ὑπὸ τοῦ $B\Gamma\Delta E$ κύκλου μετρῆσαι. δεδόσθω ἡ μὲν AB μονάδων $\bar{\kappa}$, ἡ δὲ $B\Gamma$ διάμετρος μονάδων $\bar{\beta}$.

εἰλήφθω τὸ κέντρον τοῦ κύκλου τὸ Z, καὶ ἀπὸ τῶν A, Z τῷ ὑποκειμένῳ ἐπιπέδῳ πρὸς ὀρθὰς ἤχθωσαν αἱ ΔΖΕ, ΗΑΘ. καὶ διὰ τῶν Δ , E τῆ AB παράλ-478

A remains stationary, let AB revolve in the plane until it concludes its motion at the place where it started, the circle BF Δ E remaining throughout perpendicular to the plane of the horizontal. Then the circumference BF Δ E will generate a certain surface, which is called *spiric*; and if the whole circle do not revolve, but only a segment of it, the segment of the circle will again generate a segment of a spiric surface, such as are the *spirae* on which columns rest; for as there are three surfaces in the so-called *anagrapheus*, which some call also *emboleus*, two concave (the extremes) and one (the middle) convex, when the three are moved round simultaneously they generate the form of the *spira* on which columns rest.^a

Let it then be required to measure the spire generated by the circle $B\Gamma\Delta E$. Let AB be given as 20, and the diameter BI as 12. Let Z be the centre of the circle, and through b A, Z let HA θ , Δ ZE be drawn perpendicular to the plane of the horizontal. And through Δ , E let Δ H, E θ be drawn parallel to

^a The ἀναγραφεύς or ἐμβολεύς is the pattern or templet for applying to an architectural feature, in this case an Attic-Ionic

applying to an architectural feature, in column-base. The Attic-Ionic base consists essentially of two convex mouldings, separated by a concave one. In practice, there are always narrow vertical ribbons between the convex mouldings and the concave one, but Heron ignores them. In the templet, there are naturally two concave surfaces separated by a convex, and the kind of figure Heron had in mind appears to be that here illustrated. I am indebted to Mr. D.

trated. I am indebted to Mr. D. S. Robertson, Regius Professor of Greek in the University of Cambridge, for help in elucidating this passage.

b Lit. "from."

ληλοι ήγθωσαν αί ΔΗ, ΕΘ. δέδεικται δὲ Διονυσοδώρω έν τῶ Περὶ τῆς σπείρας ἐπιγραφομένω, ότι δυ λόγου έχει ο ΒΓΔΕ κύκλος πρός το ήμισυ τοῦ ΔΕΗΘ παραλληλογράμμου, τοῦτον ἔχει καὶ ή γεννηθείσα σπείρα ύπο τοῦ ΒΓΔΕ κύκλου προς τον κύλινδρον, οδ άξων μέν έστιν ο ΗΘ, ή δε έκ τοῦ κέντρου τῆς βάσεως ἡ ΕΘ. ἐπεὶ οὖν ἡ ΒΓ μονάδων $\iota \bar{\beta}$ ἐστίν, ἡ ἄρα $Z\Gamma$ ἔσται μονάδων \bar{s} . ἔστι δὲ καὶ ἡ $A\Gamma$ μονάδων $\bar{\eta}$ ἔσται ἄρα ἡ AZμονάδων ιδ, τουτέστιν ή ΕΘ, ήτις έστιν έκ τοῦ κέντρου της βάσεως τοῦ εἰρημένου κυλίνδρου δοθείς άρα εστίν ο κύκλος αλλά και ο άξων δοθείς. έστιν γὰρ μονάδων ιβ, ἐπεὶ καὶ ἡ ΔΕ. ὥστε δοθείς καὶ ὁ εἰρημένος κύλινδρος καὶ ἔστι τὸ ΔΘ παραλληλόγραμμον (δοθέν) δστε καὶ τὸ ημισυ αὐτοῦ. ἀλλὰ καὶ ὁ ΒΓΔΕ κύκλος δοθεῖσα γὰρ ή ΓΒ διάμετρος. λόγος ἄρα τοῦ ΒΓΔΕ κύκλου πρὸς τὸ ΔΘ παραλληλόγραμμον δοθείς ωστε καὶ της σπείρας πρός τὸν κύλινδρον λόγος ἔστι δοθείς. καὶ ἔστι δοθείς ὁ κύλινδρος δοθὲν ἄρα καὶ τὸ στερεὸν τῆς σπείρας.

AB. Now it is proved by Dionysodorus a in the book which he wrote On the Spire that the circle B $\Gamma\Delta$ l. bears to half of the parallelogram $\Delta EH\Theta$ the same ratio as the spire generated by the circle BF Δ E bears to the cylinder having H θ for its axis and E θ for the radius of its base. Now, since B Γ is 12, Z Γ will be 6. But AI is 8: therefore AZ will be 14, and likewise Eθ, which is the radius of the base of the aforesaid cylinder. Therefore the circle is given; but the axis is also given; for it is 12, since this is the length of ΔE . Therefore the aforesaid cylinder is also given; and the parallelogram $\Delta \Theta$ is given, so that its half is also given. But the circle $B\Gamma\Delta E$ is also given; for the diameter ΓB is given. Therefore the ratio of the circle $B\Gamma\Delta E$ to the parallelogram is given; and so the ratio of the spire to the cylinder is given. And the cylinder is given; therefore the volume of the spire is also given.

Following the analysis, the synthesis may thus be done. Take 12 from 20; the remainder is 8. And add 20; the result is 28. Let the measure be taken of the cylinder having for the diameter of its base 28 and for height 12; the resulting volume is 7392. Now let the area be found of a circle having a diameter 12; the resulting area, as we learnt, is 113½. Take the half of 28; the result is 14. Multiply it by the half of 12; the result is 84. Now multiply

VOL. II 2 I 481

^a For Dionysodorus v. supra, p. 162 n. a and p. 364 n. a. If $\Delta E = H\Theta = 2r$ and $E\Theta = a$, then the volume of the spire bears to the volume of the cylinder the ratio $2\pi a . \pi r^2 : 2r . \pi a^2$ or $\pi r : a$, which, as Dionysodorus points out, is identical with the ratio of the circle to half the parallelogram, that is, $\pi r^2 : ra$ or $\pi r : a$.

πλασιάσας τὰ ζτς β ἐπὶ τὰ ρι γ ζ΄· καὶ τὰ γενόμενα παράβαλε παρὰ τὸν πδ· γίγνεται , θ γ νς $\frac{\zeta}{\delta}$. τοσούτου ἔσται τὸ στερεὸν τῆς σπείρας.

(iii.) Division of a Circle

Ibid. iii. 18, ed. H. Schöne (Heron iii.) 172. 13-174. 2

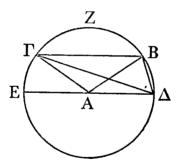

Τὸν δοθέντα κύκλον διελεῖν εἰς τρία ἴσα δυσὶν εὐθείαις. τὸ μὲν οὖν πρόβλημα ὅτι οὐ ἡητόν ἐστι, δήλον, τής εὐχρηστίας δὲ ἔνεκεν διελοῦμεν αὐτὸν ώς έγγιστα ούτω. έστω ο δοθείς κύκλος, οῦ κέντρον τὸ Α, καὶ ἐνηρμόσθω εἰς αὐτὸν τρίγωνον λοόπλευρον, οδ πλευρά ή ΒΓ, καὶ παράλληλος αὐτῆ ήγθω ή ΔΑΕ καὶ ἐπεζεύχθωσαν αἱ ΒΔ, ΔΓ. λέγω, ότι τὸ ΔΒΓ τμημα τρίτον ἔγγιστά ἐστι μέρος τοῦ όλου κύκλου. ἐπεζεύχθωσαν γὰρ αί ΒΑ, ΑΓ. δ άρα ΑΒΓΖΒ τομεύς τρίτον έστὶ μέρος τοῦ ὅλου κύκλου. καὶ ἔστιν ἴσον τὸ ΑΒΓ τρίγωνον τῶ ΒΓΔ τριγώνω τὸ ἄρα ΒΔΓΖ σχημα τρίτον μέρος έστι τοῦ ὅλου κύκλου, Ες δὴ μεῖζόν ἐστιν αὐτοῦ τὸ ΔΒΓ τμημα ἀνεπαισθήτου ὅντος ὡς πρός τον όλον κύκλον. όμοίως δέ καὶ έτέραν 482

7392 by $113\frac{1}{7}$ and divide the product by 84; the result is $9956\frac{1}{7}$. This will be the volume of the spire.

(iii.) Division of a Circle

Ibid. iii. 18, ed. H. Schöne (Heron iii.) 172. 13-174. 2

To divide a given circle into three equal parts by two straight lines. It is clear that this problem is not rational, and for practical convenience we shall make the division as closely as possible in this way. Let the given circle have A for its centre, and let there be inserted in it an equilateral triangle with side BI, and let ΔAE be drawn parallel to it, and let $B\Delta$, $\Delta \Gamma$

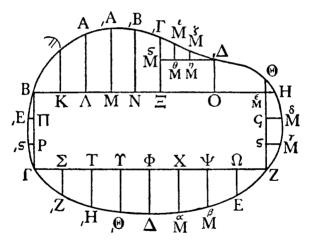

be joined. I say that the segment $\Delta B\Gamma$ is approximately a third part of the whole circle. For let BA, $A\Gamma$ be joined. Then the sector $AB\Gamma ZB$ is a third part of the whole circle. And the triangle $AB\Gamma$ is equal to the triangle $B\Gamma\Delta$ [Eucl. i. 37]; therefore the figure $B\Delta\Gamma Z$ is a third part of the whole circle, and the excess of the segment $\Delta B\Gamma$ over it is negligible in comparison with the whole circle. Similarly, if we

πλευρὰν ἰσοπλεύρου τριγώνου ἐγγράψαντες ἀφελοῦμεν ἔτερον τρίτον μέρος ὅστε καὶ τὸ καταλειπόμενον τρίτον μέρος ἔσται [μέρος]¹ τοῦ ὅλου κιίκλου.

(iv.) Measurement of an Irregular Area Heron, Diopt. 23, ed. H. Schöne (Heron iii.) 260. 18-264. 15

Τὸ δοθὲν χωρίον μετρησαι διὰ διόπτρας. ἔστω τὸ δοθὲν χωρίον περιεχόμενον ὑπὸ γραμμης

ἀτάκτου τῆς ΑΒΓΔΕΖΗΘ. έπεὶ οὖν ἐμάθομεν διὰ τῆς κατασκευασθείσης διόπτρας διάγειν πάση τῆ δοθείση εὐθεία ⟨έτέραν⟩³ πρὸς ὀρθάς, ἔλαβόν τι σημεῖον ἐπὶ τῆς περιεχούσης τὸ χωρίον γραμμῆς 484

inscribe another side of the equilateral triangle, we may take away another third part; and therefore the remainder will also be a third part of the whole circle.^a

(iv.) Measurement of an Irregular Area

Heron, *Dioptra* ^b 23, ed. H. Schöne (Heron iii.) 260. 18-264. 15

To measure a given area by means of the dioptra. Let the given area be bounded by the irregular line $AB\Gamma\Delta EZH\Theta$. Since we learnt to draw, by setting the dioptra, a straight line perpendicular to any other straight line, I took any point B on the line en-

^a Euclid, in his book On Divisions of Figures which has partly survived in Arabic, solved a similar problem—to draw in a given circle two parallel chords cutting off a certain fraction of the circle; Euclid actually takes the fraction as one-third. The general character of the third book of Heron's Metrics is very similar to Euclid's treatise.

It is in the course of this book (iii. 20) that Heron extracts the cube root of 100 by a method already noted (vol. i. pp.

60-63).

b The dioptra was an instrument fulfilling the same purposes as the modern theodolite. An elaborate description of the instrument prefaces Heron's treatise on the subject, and it was obviously a fine piece of craftsmanship, much superior to the "parallactic" instrument with which Ptolemy had to work—another piece of evidence against an early date for Heron.

closing the area, and by means of the dioptra drew any straight line BH, and drew B Γ perpendicular to it, and drew another straight line Γ Z perpendicular to this last, and similarly drew $Z\Theta$ perpendicular to Γ Z. And on the straight lines so drawn I took a series of points—on BH taking K, Λ , M, N, Ξ , O, on B Γ taking Π , P, on Γ Z taking Σ , T, Y, Φ , X, Ψ , Ω , and on $Z\Theta$ taking ε , ς . And from the points so taken on the straight lines designated by the letters, I drew the perpendiculars $K \nearrow$, Λ A, M,A, N,B, Ξ , Γ , O, Δ , Π , E, P, ε , Σ , Z, T,H,

 $Y \Theta$, $\Phi \Delta$, XM, ΨM , ΩE , SM, QM in such a manner that the extremities of the perpendiculars cut off from the line enclosing the area approximately straight lines. When this is done it will be possible

to measure the area. For the parallelogram $B\Gamma ZM$ is right-angled; so that if we measure the sides by a chain or measuring-rod, which has been carefully tested so that it can neither expand nor contract, we shall obtain the area of the parallelogram. We may similarly measure the right-angled triangles and trapezia outside this by taking their sides; for BK,

BII.E, $\Gamma P_{\mathcal{F}}$, $\Gamma \Sigma Z$, $Z\Omega E$, $Z_{\mathcal{F}}M$, ΘHM are right-angled triangles, and the remaining figures are right-angled trapezia. The triangles are measured by multiplying together the sides about the right angle and taking half the product. As for the trapezia—take half of the sum of the two parallel sides and multiply it by the perpendicular upon

the wall AB and is coiled round the axle EZ, the rope holding the load will move the weight as it winds up. In order that the wheel HO may be moved, a force of more than 200 talents is necessary, owing to the diameter of the wheel being, as postulated, five times the diameter of the axle; for this was shown in the proofs of the five mechanical powers.^a We have not, however . . .] a force of 200 talents, but only of 5. Therefore let there be another axle $K\Lambda$, lying parallel to EZ, and having the toothed wheel MN fitting on to it. Now let the teeth of the wheel HO be such as to engage with the teeth of the wheel MN. On the same axle KA let there be fitted the wheel \(\bar{\pi} \)O, whose diameter is likewise five times the diameter of the wheel MN. Now, in consequence, anyone wishing to move the weight by means of the wheel \(\beta \)O will need a force of 40 talents, since the fifth part of 200 talents is 40 talents. Again, then, let another toothed wheel IIP lie alongside the toothed wheel ZO, and let there be fitted to the toothed wheel IIP another toothed wheel \(\Sigma\)T whose diameter is likewise five times the diameter of the wheel IIP; then the force needing to be applied to the wheel ΣT will be 8 talents; but the force actually available

to us is 5 talents. Let there be placed another toothed wheel $\Upsilon\Phi$ engaging with the toothed wheel ΣT ; and fitting on to the axle of the wheel $\Upsilon\Phi$ let there be a toothed wheel $X\Psi$, whose diameter bears to the diameter of the wheel $\Upsilon\Phi$ the same ratio as 8 talents bears to the given force 5 talents.

When this construction is done, if we imagine the chest ABΓΔ as lying above the ground, with the weight hanging from the axle EZ and the force raising it applied to the wheel XΨ, neither of them will descend, provided the axles revolve freely and the juxtaposition of the wheels is accurate, but as in a beam the force will balance the weight. But if to one of them we add another small weight, the one to which the weight was added will tend to sink down and will descend, so that if, say, a mina is added to one of the 5 talents in the force it will overcome and draw the weight. But instead of this addition to the force, let there be a screw having a spiral which engages the teeth of the wheel, and let it revolve freely about pins in round holes, of which one projects beyond the chest through the wall $\Gamma\Delta$ adjacent to the screw; and then let the projecting piece be made square and be given a handle Ss. Anyone who takes this handle and turns, will turn the screw and the wheel XΨ, and therefore the wheel $\Upsilon\Phi$ joined to it. Similarly the adjacent wheel YT will revolve, and IIP joined to it, and then the adjacent wheel \(\begin{aligned} \alpha \), and then MN fitting

MENSURATION: HERON OF ALEXANDRIA unequal angles, and instead of the eye apprehending the visible object by the shortest route it would do so by a longer. For straight lines so drawn from the eye to the mirror and thence to the visible object as to make unequal angles will be found to be greater than straight lines so drawn as to make equal angles. That this is true, is here made clear.

For let the straight line AB be supposed to be the mirror, and let Γ be the observer, Δ the visible object, and let E be a point on the mirror, falling on which the sight is bent towards the visible object, and let Γ E, E Δ be joined. I say that the angle AE Γ is equal to the angle Δ EB. a

^a Different figures are given in different mss., with corresponding small variants in the text. With G. Schmidt, I have reproduced the figure in the Aldine edition.

For if it be not equal, let there be another point Z, on the mirror, falling on which the sight makes unequal angles, and let ΓZ , $Z\Delta$ be joined. It is clear that the angle ΓZA is greater than the angle ΔZE . I say that the sum of the straight lines ΓZ , $Z\Delta$ which make unequal angles with the base line AB, is greater than the sum of the straight lines ΓE , $E\Delta$, which make equal angles with AB. For let a perpendicular be drawn from Δ to AB at the point \hat{H} and let it be produced in a straight line to Θ . Then it is obvious that the angles at H are equal: for they are right angles. And let $\Delta H = H\theta$, and let ΘZ and ΘE be joined. This is the construction. Then since $\Delta H = H\Theta$, and the angle ΔHE is equal to the angle Θ HE, while HE is a common side of the two triangles, the triangle HOE is equal to the triangle Δ HE, and the remaining angles, subtended by the equal sides are severally equal one to the other [Eucl. i. 4]. Therefore $\Theta E = E\Delta$. Again, since $H\Delta = H\Theta$ and angle $\Delta HZ = \text{angle } \Theta HZ$, while HZ is common to the two triangles ΔHZ and ΘHZ , the triangle $ZH\Delta$ is equal to the triangle Θ HZ [ibid.]. Therefore $\Theta Z = Z \Delta$. And since $\Theta E = E \Delta$, let $E \Gamma$ be added to both. Then the sum of the two straight lines ΓE . $E\Delta$ is equal to the sum of the two straight lines ΓE . EO. Therefore the whole $\Gamma\Theta$ is equal to the sum of the two straight lines ΓE , $E \Delta$. And since in any triangle the sum of two sides is always greater than

(e) QUADRATIC EQUATIONS

Heron, Geom. 21. 9-10, ed. Heiberg (Heron iv.) 380. 15-31

Δοθέντων συναμφοτέρων τῶν ἀριθμῶν ἤγουν τῆς διαμέτρου, τῆς περιμέτρου καὶ τοῦ ἐμβαδοῦ τοῦ κύκλου ἐν ἀριθμῷ ἐνὶ διαστεῖλαι καὶ εὐρεῖν ἔκαστον ἀριθμόν. ποίει οὕτως ἔστω ὁ δοθεὶς ἀριθμὸς μονάδες σιβ. ταῦτα ἀεὶ ἐπὶ τὰ ρνδ· γίνονται μυριάδες γ καὶ βχμη. τούτοις προστίθει καθολικῶς ωμα· γίνονται μυριάδες τρεῖς καὶ γυπθ· ὧν πλευρὰ τετράγωνος γίνεται ρπγ· ἀπὸ τούτων κούφισον κθ· λοιπὰ ρνδ· ὧν μέρος ια΄ γίνεται ιδ· τοσούτου ἡ διάμετρος τοῦ κύκλου. ἐὰν δὲ θέλης καὶ τὴν περιφέρειαν εὐρεῖν, ὕφειλον τὰ κθ ἀπὸ τῶν ρπγ· λοιπὰ ρνδ· ταῦτα ποίησον δίς· γίνονται τῆ· τούτων λαβὲ μέρος ζ΄· γίνονται μδ· τοσούτου ἡ

^a The proof here given appears to have been taken by Olympiodorus from Heron's *Catoptrica*, and it is substantially identical with the proof in *De Speculis* 4. This work was formerly attributed to Ptolemy, but the discovery of Ptolemy's *Optics* in Arabic has encouraged the belief, now 502

the remaining side, in whatever way these may be taken [Eucl. i. 20], therefore in the triangle $\theta Z\Gamma$ the sum of the two sides θZ , $Z\Gamma$ is greater than the one side $\Gamma\theta$. But

$$\Gamma\Theta = \Gamma E + E\Delta;$$

$$\therefore \qquad \Theta Z + Z\Gamma > \Gamma E + E\Delta.$$
But
$$\Theta Z = Z\Delta;$$

$$\therefore \qquad Z\Gamma + Z\Delta > \Gamma E + E\Delta.$$

And ΓZ , $Z \Delta$ make unequal angles; therefore the sum of straight lines making unequal angles is greater than the sum of straight lines making equal angles; which was to be proved.^a

(e) QUADRATIC EQUATIONS

Heron, Geometrica 21. 9-10, ed. Heiberg (Heron iv.) 380. 15-31

Given the sum of the diameter, perimeter and area of a circle, to find each of them separately. It is done thus: Let the given sum be 212. Multiply this by 154; the result is 32648. To this add 841, making 33489, whose square root is 183. From this take away 29, leaving 154, whose eleventh part is 14; this will be the diameter of the circle. If you wish to find the circumference, take 29 from 183, leaving 154; double this, making 308, and take the seventh part, which is 44; this will be the perimeter. To

usually held, that it is a translation of Heron's Catoptrica. The translation, made by William of Moerbeke in 1269, can be shown by internal evidence to have been made from the Greek original and not from an Arabic translation. It is published in the Teubner edition of Heron's works, vol. ii. part i.

περίμετρος. τὸ δὲ ἐμβαδὸν εὐρεῖν. ποίει οὕτως· τὰ ιδ τῆς διαμέτρου ἐπὶ τὰ μδ τῆς περιμέτρου γίνονται χις· τούτων λαβὲ μέρος τέταρτον· γίνονται ρνδ· τοσοῦτον τὸ ἐμβαδὸν τοῦ κύκλου. ὁμοῦ τῶν τριῶν ἀριθμῶν μονάδες σιβ.

(f) Indeterminate Analysis

Heron, Geom. 24. 1, ed. Heiberg (Heron iv.) 414. 28-415. 10

Εύρεῖν δύο χωρία τετράγωνα, ὅπως τὸ τοῦ πρώτου ἐμβαδὸν τοῦ τοῦ δευτέρου ἐμβαδοῦ ἔσται τριπλάσιον. ποιῶ οὕτως τὰ ȳ κύβισον γίνονται

 o If d is the diameter of the circle, then the given relation is that

$$d + \frac{22}{7}d + \frac{11}{14}d^2 = 212,$$

$$\frac{11}{14}d^2 + \frac{29}{7}d = 212.$$

i.e.

To solve this quadratic equation, we should divide by ‡‡ so as to make the first term a square; Heron makes the first term a square by multiplying by the lowest requisite factor, in this case 154, obtaining the equation

$$11^2d^2+2 \cdot 29 \cdot 11d=154 \cdot 212$$
.

By adding 841 he completes the square on the left-hand side

$$(11d + 29)^2 = 154 \cdot 212 + 841$$

$$= 32648 + 841$$

$$= 33489.$$

$$\therefore \qquad 11d + 29 = 183.$$

$$\therefore \qquad 11d = 154.$$
and
$$d = 14.$$

The same equation is again solved in *Geom.* 24. 46 and a similar one in *Geom.* 24. 47. Another quadratic equation is solved in *Geom.* 24. 3 and the result of yet another is given in *Metr.* iii. 4.

find the area. It is done thus: Multiply the diameter, 14, by the perimeter, 44, making 616; take the fourth part of this, which is 154; this will be the area of the circle. The sum of the three numbers is 212.4

(f) Indeterminate Analysis b Heron, Geometrica 24. 1, ed. Heiberg (Heron iv.) 414. 28-415. 10

To find two rectangles such that the area of the first is three times the area of the second.^c I proceed thus:

b The Constantinople Ms. in which Heron's Metrica was found in 1896 contains also a number of interesting problems in indeterminate analysis; and two were already extant in Heron's Geëponicus. The problems, thirteen in all, are now published by Heiberg in Heron iv. 414. 28–426. 29.

c It appears also to be a condition that the perimeter of the second should be three times the perimeter of the first. If we substitute any factor n for 3 the general problem becomes: To solve the equations

$$u+v=n(x+y) \qquad . \qquad . \qquad (1)$$

$$xy = n \cdot uv$$
 (2)

The solution given is equivalent to

$$x = 2n^3 - 1,$$
 $y = 2n^3$
 $v = n(4n^3 - 2),$ $v = n.$

Zeuthen (Bibliotheca mathematica, viii. (1907-1908), pp. 118-134) solves the problem thus: Let us start with the hypothesis that v=n. It follows from (1) that u is a multiple of n, say nz. We have then

or $(x-n^3)(y-n^3)=n^3(n^3-1)$.

An obvious solution of this equation is $x - n^3 = n^3 - 1$, $y - n^3 = n^3$.

which gives $z=4n^3-2$, whence $u=n(4n^3-2)$. The other values follow.

κζ· ταῦτα δίς· γίνονται νδ. νῦν ἄρον μονάδα \bar{a} · λοιπὸν γίνονται $\bar{v}\gamma$. ἔστω οὖν ἡ μὲν μία πλευρὰ ποδῶν $\bar{v}\gamma$, ἡ δὲ ἑτέρα πλευρὰ ποδῶν $\bar{v}\delta$. καὶ τοῦ ἄλλου χωρίου οὕτως· θὲς όμοῦ τὰ $\bar{v}\gamma$ καὶ τὰ $\bar{v}\delta$ · γίνονται πόδες $\bar{\rho}\zeta$ · ταῦτα ποίει ἐπὶ τὰ $\bar{\gamma}$ ··· λοιπὸν γίνονται πόδες $\bar{\tau}\bar{i}\eta$. ἔστω οὖν ἡ τοῦ προτέρου πλευρὰ ποδῶν $\bar{\tau}\bar{i}\eta$, ἡ δὲ ἐτέρα πλευρὰ ποδῶν $\bar{\gamma}$ · τὰ δὲ ἐμβαδὰ τοῦ ένὸς γίνεται ποδῶν $\bar{\gamma}v\delta$ καὶ τοῦ ἄλλου ποδῶν $\bar{\beta}\omega\xi\bar{\beta}$.

Ibid. 24. 10, ed. Heiberg (Heron iv.) 422, 15-424, 5

Τριγώνου όρθογωνίου τὸ ἐμβαδὸν μετὰ τῆς περιμέτρου ποδών σπ. ἀποδιαστείλαι τὰς πλευράς καὶ εύρεῖν τὸ ἐμβαδόν. ποιῶ οὕτως ἀεὶ ζήτει τοὺς απαρτίζοντας αριθμούς· απαρτίζει δε τον σπ ο δίς $\overline{\lambda\epsilon}$, δ ι΄ τὸν $\overline{\kappa\eta}$, δ ι δ ΄ τὸν $\overline{\kappa}$. ϵ σκεψάμην, ὅτι δ $\overline{\eta}$ καὶ λε ποιήσουσι τὸ δοθὲν ἐπίταγμα. τῶν σπ τὸ η΄ γίνονται πόδες λε. διὰ παντός λάμβανε δυάδα τῶν η λοιπὸν μένουσιν ς πόδες. τὰ οὖν λε καὶ τὰ \bar{s} όμοῦ γίνονται πόδες $\bar{\mu}a$. ταῦτα ποίει ἐφ' έαυτά· γίνονται πόδες $\bar{\lambda}a$. τὰ $\bar{\lambda}a$ ἐπὶ τὰ $\bar{s}a$. γίνονται πόδες δι ταθτα ποίει αξι έπι τὰ η γίνονται πόδες σχπ. ταθτα άρον άπο των σχπα. λοιπον μένει α. ων πλευρά τετραγωνική γίνεται α. άρτι θès τὰ μα καὶ άρον μονάδα ā· λοιπὸν μ̄· ὧν χίνεται κ. τοῦτό ἐστιν ἡ κάθετος, ποδῶν κ. καὶ θὲς πάλιν τὰ μα καὶ πρόσθες ᾱ. γίνονται πόδες μβ. ὧν Δ΄ γίνεται πόδες και ἔστω ἡ βάσις ποδῶν και καὶ θèς τὰ λε καὶ άρον τὰ ς· λοιπὸν μένουσι 506

Take the cube of 3, making 27; double this, making 54. Now take away 1, leaving 53. Then let one side be 53 feet and the other 54 feet. As for the other rectangle, [I proceed] thus: Add together 53 and 54, making 107 feet: multiply this by 3, [making 321; take away 3], leaving 318. Then let one side be 318 feet and the other 3 feet. The area of the one will be 954 feet and of the other 2862 feet.⁴

Ibid. 24. 10, ed. Heiberg (Heron iv.) 422. 15-424. 5

In a right-angled triangle the sum of the area and the perimeter is 280 feet; to separate the sides and find the area. I proceed thus: Always look for the factors; now 280 can be factorized into 2.140, 4.70, 5.56, 7.40, 8.35, 10.28, 14.20. By inspection, we find 8 and 35 fulfil the requirements. For take oneeighth of 280, getting 35 feet. Take 2 from 8. leaving 6 feet. Then 35 and 6 together make 41 feet. Multiply this by itself, making 1681 feet. Now multiply 35 by 6, getting 210 feet. Multiply this by 8, getting 1680 feet. Take this away from the 1681, leaving 1, whose square root is 1. Now take the 41 and subtract 1, leaving 40, of which the half is 20; this is the perpendicular, 20 feet. And again take 41 and add 1, getting 42 feet, of which the half is 21; and let this be the base, 21 feet. And take 35 and subtract 6, leaving 29 feet. Now multiply

[°] The term "feet," $\pi\delta\delta\epsilon$ s, is used by Heron indiscriminately of lineal feet, square feet and the sum of numbers of lineal and square feet.

πόδες $\overline{\kappa}\theta$. ἄρτι θὲς τὴν κάθετον ἐπὶ τὴν βάσιν $\mathring{\omega}$ ν \angle ΄ γίνεται πόδες $\overline{\sigma}$ ι· καὶ αἱ τρεῖς πλευραὶ περιμετρούμεναι ἔχουσι πόδας $\overline{\sigma}$ · ὁμοῦ σύνθες μετὰ τοῦ ἐμβαδοῦ· γίνονται πόδες $\overline{\sigma}$ π.

$$s = \frac{1}{2}(a+b+c)$$
.

Then

$$S = rs = \frac{1}{2}ab$$
, $r + s = a + b$, $c = s - r$.

Solving the first two equations, we have

$$\frac{a}{b}$$
 = $\frac{1}{2}[r+s \mp \sqrt{(r+s)^2 - 8rs}],$

and this formula is actually used in the problem. The

^a Heath (H.G.M. ii. 446-447) shows how this solution can be generalized. Let a, b be the sides of the triangle containing the right angle, r the hypotenuse, S the area of the triangle, r the radius of the inscribed circle; and let

the perpendicular and the base together, [getting 420], of which the half is 210 feet; and the three sides comprising the perimeter amount to 70 feet; add them to the area, getting 280 feet.^a

method is to take the sum of the area and the perimeter S+2s, separated into its two obvious factors s(r+2), to put s(r+2)=A (the given number), and then to separate A into suitable factors to which s and r+2 may be equated. They must obviously be such that sr, the area, is divisible by 6.

In the given problem A=280, and the suitable factors are r+2=8, s=35, because r is then equal to 6 and rs is a multiple of 6. Then

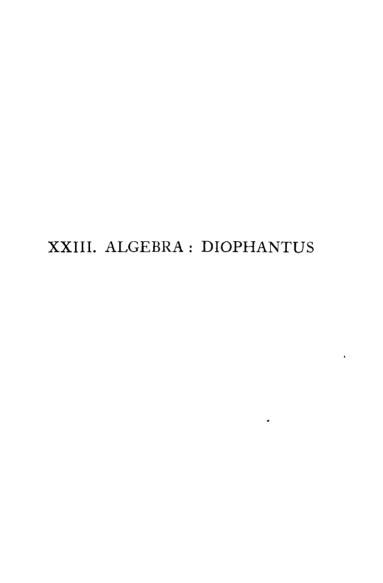

$$a = \frac{1}{2}[6 + 35 - \sqrt{(6 + 35)^2 - 8 \cdot 6 \cdot 35}] = \frac{1}{2}(41 - 1) = 20$$

$$b = \frac{1}{2}(41 + 1) = 21,$$

 $c = 35 - 6 = 29.$

This problem is followed by three more of the same type.

XXIII. ALGEBRA: DIOPHANTUS

(a) GENERAL

Anthol. Palat. xiv. 126, The Greek Anthology, ed. Paton (L.C.L.) v. 92-93

Ουτός τοι Διόφαντον ἔχει τάφος α μέγα θαθμα καὶ τάφος ἐκ τέχνης μέτρα βίοιο λέγει. ἔκτην κουρίζειν βιότου θεὸς ὤπασε μοίρην δωδεκάτην δ' ἐπιθείς, μῆλα πόρεν χνοάειν τῆ δ' ἄφ' ἐφ' ἐβδομάτη τὸ γαμήλιον ήψατο φέγγος, ἐκ δὲ γάμων πέμπτω παιδ' ἐπένευσεν ἔτει. αἰαι, τηλύγετον δειλὸν τέκος, ήμισυ πατρὸς τοῦδε καὶ ἡ κρυερὸς μέτρον ἐλὼν βιότου. πένθος δ' αὖ πισύρεσσι παρηγορέων ἐνιαυτοις τῆδε πόσου σοφίη τέρμ' ἐπέρησε βίου.

Problems in indeterminate analysis solved before the time of Diophantus include the Pythagorean and Platonic methods of finding numbers representing the sides of right-angled triangles (v. vol. i. pp. 90-95), the methods (also Pythagorean) of finding "side- and diameter-numbers" (vol. i. pp. 132-139), Archimedes' Cattle Problem (v. supra, pp. 202-205) and Heron's problems (v. supra, pp. 504-509).

^a There are in the Anthology 46 epigrams which are algebraical problems. Most of them (xiv. 116-146) were collected by Metrodorus, a grammarian who lived about A.D. 500, but their origin is obviously much earlier and many belong to a type described by Plato and the scholiast to the Charmides (v. vol. i. pp. 16, 20).

XXIII. ALGEBRA: DIOPHANTUS

(a) GENERAL

Palatine Anthology a xiv. 126, The Greek Anthology, ed. Paton (L.C.L.) v. 92-93

This tomb holds Diophantus. Ah, what a marvel! And the tomb tells scientifically the measure of his life. God vouchsafed that he should be a boy for the sixth part of his life; when a twelfth was added, his cheeks acquired a beard; He kindled for him the light of marriage after a seventh, and in the fifth year after his marriage He granted him a son. Alas! late-begotten and miserable child, when he had reached the measure of half his father's life, the chill grave took him. After consoling his grief by this science of numbers for four years, he reached the end of his life. ^b

Diophantus's surviving works and ancillary material are admirably edited by Tannery in two volumes of the Teubner series (Leipzig, 1895). There is a French translation by Paul Ver Eecke, Diophante d'Alexandre (Bruges, 1926). The history of Greek algebra as a whole is well treated by G. F. Nesselmann, Die Algebra der Griechen, and by T. L. Heath, Diophantus of Alexandria: A Study in the History of Greek Algebra, 2nd ed. 1910.

b If x was his age at death, then

$$\frac{1}{6}x + \frac{1}{12}x + \frac{1}{7}x + 5 + \frac{1}{2}x + 4 = x$$

whence x=84.

VOL. II 2 L 513

Theon Alex. in Ptol. Math. Syn. Comm. i. 10, ed. Rome, Studi e Testi, lxxii. (1936), 453. 4-6

Καθ' ἃ καὶ Διόφαντός φησι: "τῆς γὰρ μονάδος ἀμεταθέτου οὔσης καὶ ἐστώσης πάντοτε, τὸ πολλαπλασιαζόμενον εἶδος ἐπ' αὐτὴν αὐτὸ τὸ εἶδος ἔσται."

Dioph. De polyg. num. [5], Dioph. ed. Tannery i. 470. 27-472. 4

Καὶ ἀπεδείχθη τὸ παρὰ Ὑψικλεῖ ἐν ὅρῳ λεγόμενον, ὅτι, '' ἐὰν ὧσιν ἀριθμοὶ ἀπὸ μονάδος ἐν ἴσῃ ὑπεροχῇ ὁποσοιοῦν, μονάδος μενούσης τῆς ὑπεροχῆς, ὁ σύμπας ἐστὶν ⟨τρίγωνος, δυάδος δέ⟩, τετράγωνος, τριάδος δέ, πεντάγωνος· λέγεται δὲ τὸ πλῆθος τῶν γωνιῶν κατὰ τὸν δυάδι μείζονα τῆς ὑπεροχῆς, πλευραὶ δὲ αὐτῶν τὸ πλῆθος τῶν ἐκτεθέντων σὺν τῇ μονάδι.''

Mich. Psell. Epist., Dioph. ed. Tannery ii. 38, 22-39, 1

1 τρίγωνος, δυάδος δέ add. Bachet.

^a Cf. Dioph. ed. Tannery i. 8. 13-15. The word είδοs, as will be seen in due course, is regularly used by Diophantus for a term of an equation.

514

Theon of Alexandria, Commentary on Ptolemy's Syntaxis i. 10, ed. Rome, Studi e Testi, lxxii. (1936), 453. 4-6

As Diophantus says: "The unit being without dimensions and everywhere the same, a term that is multiplied by it will remain the same term." a

Diophantus, On Polygonal Numbers [5], Dioph. ed. Tannery i. 470. 27-472. 4

There has also been proved what was stated by Hypsicles in a definition, namely, that "if there be as many numbers as we please beginning from 1 and increasing by the same common difference, then, when the common difference is 1, the sum of all the numbers is a triangular number; when 2, a square number; when 3, a pentagonal number [; and so on]. The number of angles is called after the number which exceeds the common difference by 2, and the sides after the number of terms including 1." b

Michael Psellus, a Letter, Dioph. ed. Tannery ii. 38. 22-39. 1

Diophantus dealt more accurately with this Egyptian method, but the most learned Anatolius collected the most essential parts of the theory as stated by

b i.e., the nth a-gonal number (1 being the first) is

 $\frac{1}{2}n(2+(n-1)(a-2))$; v. vol. i. p. 98 n. a.

^e Michael Psellus, "first of philosophers" in a barren age, flourished in the latter part of the eleventh century A.D. There has survived a book purporting to be by Psellus on arithmetic, music, geometry and astronomy, but it is clearly not all his own work. In the is observed that the most favoured meth a of a circle is to take the mean between cumscribed squares, which would give $\pi = \sqrt{8} = 2.8284271$.

έκεινον επιστήμης απολεξάμενος ετέρως Διοφάντω συνοπτικώτατα προσεφώνησε.

Dioph. Arith. i., Praef., Dioph. ed. Tannery i. 14. 25-16. 7

Νῦν δ' ἐπὶ τὰς προτάσεις χωρήσωμεν όδόν, πλείστην ἔχοντες τὴν ἐπ' αὐτοῖς τοῖς εἴδεσι συνηθροισμένην ὕλην. πλείστων δ' ὄντων τῷ ἀριθμῷ καὶ μεγίστων τῷ ὄγκῳ, καὶ διὰ τοῦτο βραδέως βεβαιουμένων ὑπὸ τῶν παραλαμβανόντων αὐτὰ καὶ ὄντων ἐν αὐτοῖς δυσμνημονευτῶν, ἐδοκίμασα τὰ ἐν αὐτοῖς ἐπιδεχόμενα διαιρεῖν, καὶ μάλιστα τὰ ἐν ἀρχῆ ἔχοντα στοιχειώδως ἀπὸ ἀπλουστέρων ἐπὶ σκολιώτερα διελεῖν ὡς προσῆκεν. οὕτως γὰρ εὐόδευτα γενήσεται τοῖς ἀρχομένοις, καὶ ἡ ἀγωγὴ αὐτῶν μνημονευθήσεται, τῆς πραγματείας αὐτῶν ἐν τρισκαίδεκα βιβλίοις γεγενημένης.

b Of these thirteen books in the Arithmetica, only six 516

^a The two passages cited before this one allow us to infer that Diophantus must have lived between Hypsicles and Theon, say 150 B.C. to A.D. 350. Before Tannery edited Michael Psellus's letter, there was no further evidence, but it is reasonable to infer from this letter that Diophantus was a contemporary of Anatolius, bishop of Laodicea about A.D. 280 (v. vol. i. pp. 2-3). For references by Plato and a scholiast to the Egyptian methods of reckoning, v. vol. i. pp. 16, 20.

him in a different way and in the most concise form, and dedicated his work to Diophantus.^a

Diophantus, Arithmetica i., Preface, Dioph. ed. Tannery i. 14. 25-16. 7

Now let us tread the path to the propositions themselves, which contain a great mass of material compressed into the several species. As they are both numerous and very complex to express, they are only slowly grasped by those into whose hands they are put, and include things hard to remember; for this reason I have tried to divide them up according to their subject-matter, and especially to place, as is fitting, the elementary propositions at the beginning in order that passage may be made from the simpler to the more complex. For thus the way will be made easy for beginners and what they learn will be fixed in their memory; the treatise is divided into thirteen books.

Ibid. v. 3, Dioph. ed. Tannery i. 316. 6

We have it in the Porisms.

have survived. Tannery suggests that the commentary on it written by Hypatia, daughter of Theon of Alexandria, extended only to these first six books, and that consequently little notice was taken of the remaining seven. There would be a parallel in Eutocius's commentaries on Apollonius's Conics. Nesselmann argues that the lost books came in the middle, but Tannery (Dioph. ii. xix-xxi) gives strong reasons for thinking it is the last and most difficult books which have been lost.

Whether this collection of propositions in the Theory of Numbers, several times referred to in the Arithmetica, formed a separate treatise from, or was included in, that work is disputed; Hultsch and Heath take the former view, in my opinion judiciously, but Tannery takes the latter.

(b) NOTATION a

Ibid. i., Preface, Dioph. ed. Tannery i. 2. 3-6. 21

Knowing that you are anxious, my most esteemed Dionysius, to learn how to solve problems in numbers, I have tried, beginning from the foundations on which the subject is built, to set forth the nature and power in numbers.

Perhaps the subject will appear to you rather difficult, as it is not yet common knowledge, and the minds of beginners are apt to be discouraged by mistakes; but it will be easy for you to grasp, with your enthusiasm and my teaching; for keenness backed by teaching is a swift road to knowledge.

As you know, in addition to these things, that all numbers are made up of some multitude of units, it is clear that their formation has no limit. Among them are—

squares, which are formed when any number is multiplied by itself; the number itself is called the side of the square b ;

cubes, which are formed when squares are multi-

plied by their sides,

square-squares, which are formed when squares are multiplied by themselves;

square-cubes, which are formed when squares are

^a This subject is admirably treated, with two original contributions, by Heath, *Diophantus of Alexandria*, 2nd ed., pp. 34-53. Diophantus's method of representing large numbers and fractions has already been discussed (vol. i. pp. 44-45). Among other abbreviations used by Diophantus are \Box^{os} , declined throughout its cases, for $\tau erp \dot{\alpha} y \omega v o s$; and io. (apparently ω in the archetype) for the sign =, connecting two sides of an equation.

b Or "square root."

τοὺς ἀπὸ τῆς αὐτῆς αὐτοῖς πλευρᾶς κύβους πολυπλασιασθέντων,

ών δὲ κυβοκύβων, οι εἰσιν ἐκ κύβων ἐφ' ἑαυτοὺς πολυπλασιασθέντων,

ἔκ τε τῆς τούτων ἤτοι συνθέσεως ἢ ὑπεροχῆς ἢ πολυπλασιασμοῦ ἢ λόγου τοῦ πρὸς ἀλλήλους ἢ καὶ ἐκάστων πρὸς τὰς ἰδίας πλευρὰς συμβαίνει πλέκεσθαι πλεῖστα προβλήματα ἀριθμητικά· λύεται δὲ βαδίζοντός σου τὴν ὑποδειχθησομένην ὁδόν.

Έδοκιμάσθη οὖν ἕκαστος τούτων τῶν ἀριθμῶν συντομωτέραν ἐπωνυμίαν κτησάμενος στοιχεῖον τῆς ἀριθμητικῆς θεωρίας εἶναι· καλεῖται οὖν ὁ μὲν τετράγωνος· δύναμις καὶ ἔστιν αὐτῆς σημεῖον τὸ Δ ἐπίσημον ἔχον Υ, $\Delta^{\rm v}$ δύναμις·

- ό δὲ κύβος καὶ ἔστιν αὐτοῦ σημεῖον \mathbf{K} ἐπίσημον ἔχον $\mathbf{\Upsilon}$, \mathbf{K}^{v} κύβος·
- ό δὲ ἐκ τετραγώνου ἐφ' ἐαυτὸν πολυπλασιασθέντος δυναμοδύναμις καὶ ἔστιν αὐτοῦ σημεῖον δέλτα δύο ἐπίσημον ἔχοντα Υ, $\Delta^{\rm Y}\Delta$ δυναμοδύναμις·
- ό δὲ ἐκ τετραγώνου ἐπὶ τὸν ἀπὸ τῆς αὐτῆς αὐτῷ πλευρᾶς κύβου πολυπλασιασθέντος δυναμόκυβος καὶ ἔστιν αὐτοῦ σημεῖον τὰ ΔK ἐπίσημον ἔχοντα Υ , ΔK^{Υ} δυναμόκυβος·
- ό δὲ ἐκ κύβου ἑαυτὸν πολυπλασιάσαντος κυβόκυβος καὶ ἔστιν αὐτοῦ σημεῖον δύο κάππα ἐπίσημον ἔχοντα Υ, Κ^{*}Κ κυβόκυβος.

multiplied by the cubes formed from the same side:

cube-cubes, which are formed when cubes are multi-

plied by themselves;

and it is from the addition, subtraction, or multiplication of these numbers or from the ratio which they bear one to another or to their own sides that most arithmetical problems are formed; you will be able to solve them if you follow the method shown below.

Now each of these numbers, which have been given abbreviated names, is recognized as an element in arithmetical science; the *square* [of the unknown quantity]^a is called *dynamis* and its sign is Δ with the index Y, that is Δ^{Y} ;

the cube is called *cubus* and has for its sign K with the index Y, that is K^{Y} ;

the square multiplied by itself is called dynamo-dynamis and its sign is two deltas with the index Υ , that is $\Delta^{\mathbf{Y}}\Delta$;

the square multiplied by the cube formed from the same root is called *dynamocubus* and its sign is ΔK with the index Υ , that is ΔK^{Υ} ;

the cube multiplied by itself is called *cubocubus* and its sign is two kappas with the index Υ , $K^{Y}K$.

a It is not here stated in so many words, but becomes obvious as the argument proceeds that δύναμις and its abbreviation are restricted to the square of the unknown quantity; the square of a determinate number is $\tau \epsilon \tau \rho \alpha \gamma \omega v o s$. There is only one term, $\kappa \iota \beta \rho s$, for the cube both of a determinate and of the unknown quantity. The higher terms, when written in full as δυναμοδύναμις, δυναμόκυβος and κυβόκυβος, are used respectively for the fourth, fifth and sixth powers both of determinate quantities and of the unknown, but their abbreviations, and that for $\kappa \iota \beta \rho s$, are used to denote powers of the unknown only.

'Ο δὲ μηδὲν τούτων τῶν ἰδιωμάτων κτησάμενος, ἔχων δὲ ἐν ἑαυτῷ πλῆθος μονάδων ἀόριστον, ἀριθμὸς καλεῖται καὶ ἔστιν αὐτοῦ σημεῖον τὸ Ξ.

Έστι δὲ καὶ ἔτερον σημεῖον τὸ ἀμετάθετον τῶν ώρισμένων, ἡ μονάς, καὶ ἔστιν αὐτῆς σημεῖον τὸ Μ

έπίσημον έχον τὸ Ο, Μ.

"Ωσπερ δε των άριθμων τὰ δμώνυμα μόρια παρομοίως καλείται τοῖς ἀριθμοῖς, τοῦ μεν τρία τὸ
τρίτον, τοῦ δε τέσσαρα τὸ τέταρτον, οὕτως καὶ
τῶν νῦν ἐπονομασθέντων ἀριθμῶν τὰ δμώνυμα
μόρια κληθήσεται παρομοίως τοῖς ἀριθμοῖς.

τοῦ μὲν ἀριθμοῦ τὸ ἀριθμοστόν,
τῆς δὲ δυνάμεως τὸ δυναμοστόν,
τοῦ δὲ κύβου τὸ κυβοστόν,
τοῦ δὲ δυναμοδυνάμεως τὸ δυναμοδυναμοστόν,
τοῦ δὲ δυναμοκύβου τὸ δυναμοκυβοστόν,
τοῦ δὲ κυβοκύβου τὸ κυβοκυβοστόν.

ἔξει δὲ ἕκαστον αὐτῶν ἐπὶ τὸ τοῦ δμωνύμου ἀριθμοῦ σημεῖον γραμμὴν Χ διαστέλλουσαν τὸ εἶδος.

Diophantus has only one symbol for an unknown quantity, but his problems often lead to subsidiary equations involving other unknowns. He shows great ingenuity in isolating these subsidiary unknowns. In the translation I shall use

522

^a I am entirely convinced by Heath's argument, based on the Bodleian MS. of Diophantus and general considerations, that this symbol is really the first two letters of $d\rho t \theta \mu \delta s$; this suggestion brings the symbol into line with Diophantus's abbreviations for δύναμις, κύβος, and so on. It may be declined throughout its cases, e.g., $\mathbf{S}^{\hat{\omega}\nu}$ for the genitive plural, infra p. 552, line 5.

The number which has none of these characteristics, but merely has in it an undetermined multitude of units, is called *arithmos*, and its sign is S[x].

There is also another sign denoting the invariable element in determinate numbers, the unit, and its sign is M with the index O, that is M.

As in the case of numbers the corresponding fractions are called after the numbers, a *third* being called after 3 and a *fourth* after 4, so the functions named above will have reciprocals called after them:

$$arithmos [x] \qquad arithmoston \left\lfloor \frac{1}{x} \right\rfloor,$$

$$dynamis \left[x^2 \right] \qquad dynamoston \left[\frac{1}{x^2} \right],$$

$$cubus \left[x^3 \right] \qquad cuboston \left[\frac{1}{x^3} \right],$$

$$dynamodynamis \left[x^4 \right] \qquad dynamodynamoston \left[\frac{1}{x^4} \right],$$

$$dynamocubus \left[x^5 \right] \qquad dynamocuboston \left[\frac{1}{x^5} \right],$$

$$cubocubus \left[x^6 \right] \qquad cubocuboston \left[\frac{1}{x^6} \right].$$

And each of these will have the same sign as the corresponding process, but with the mark χ to distinguish its nature.

different letters for the different unknowns as they occur, for example, x, z, m.

Diophantus does not admit negative or zero values of the unknown, but positive fractional values are admitted.

^b So the symbol is printed by Tannery, but there are many variants in the MSS.

A minus multiplied by a minus makes a plus,^a a minus multiplied by a plus makes a minus, and the sign of a minus is a truncated Ψ turned upside down, that is Λ .^b

(c) DETERMINATE EQUATIONS

(i.) Pure c Determinate Equations

Ibid. i., Preface, Dioph. ed. Tannery i. 14. 11-20

Next, if there result from a problem an equation in which certain terms are equal to terms of the same species, but with different coefficients, it will be necessary to subtract like from like on both sides until one term is found equal to one term. If perchance there be on either side or on both sides any negative terms, it will be necessary to add the negative terms on both sides, until the terms on both sides become positive, and again to subtract like from like until on each side one term only is left.^d

and cannot agree with Heath (H.G.M. ii. 459) that "the description is evidently interpolated." But Heath seems right in his conjecture, first made in 1885, that the sign Λ is a compendium for the root of the verb $\lambda\epsilon i\pi\epsilon\nu$, and is, in fact, a Λ with an I placed in the middle. When the sign is resolved in the manuscripts into a word, the dative $\lambda\epsilon i\psi\epsilon\iota$ is generally used, but there is no conclusive proof that Diophantus himself used this non-classical form.

^c A pure equation is one containing only one power of the unknown, whatever its degree: a mixed equation contains

more than one power of the unknown.

^a In modern notation, Diophantus manipulates the equation until it is of the form $Ax^n = B$; as he recognizes only one value of x satisfying this equation, it is then considered solved.

(ii.) Quadratic Equations a

Ibid. iv. 39, Dioph. ed. Tannery i. 298. 7-306. 8

To find three numbers such that the difference of the greatest and the middle has to the difference of the middle and the least a given ratio, and further such that the sum of any two is a square.

Let it be laid down that the difference of the greatest and the middle has to the difference of the

middle and the least the ratio 3:1.

Since the sum of the middle term and the least makes a square, let it be 4. Then the middle term > 2. Let it be x + 2. Then the least term = 2 - x.

And since the difference of the greatest and the middle has to the difference of the middle and the least the ratio 3:1, and the difference of the middle and the least is 2x, therefore the difference of the greatest and the middle is 6x, and therefore the greatest will be 7x + 2.

There remain two conditions, that the sum of the greatest and the least make a square and the sum of the greatest and the middle make a square. And I am left with the double equation b

8x + 4 = a square, 6x + 4 = a square.

And as the units are squares, the equation is convenient to solve.

^a The quadratic equation takes up only a small part of this problem, but the whole problem will give an excellent illustration of Diophantus's methods, and especially of his ingenuity in passing from one unknown to another. The geometrical solution of quadratic equations by the application of areas is treated in vol. i. pp. 192-215, and Heron's algebraical formula for solving quadratics, supra, pp. 502-505.

b For double equations, v. infra p. 543 n. b.

Πλάσσω ἀριθμοὺς δύο ἵνα ὁ ὑπ' αὐτῶν ἢ $\Xi \bar{\beta}$, καθὼς ἵσμεν διπλῆν ἰσότητα· ἔστω οὖν $\Xi \bar{\angle}'$ καὶ \mathring{M} δ· καὶ γίνεται ὁ $\Xi \mathring{M}$ ρι $\hat{\beta}$. ἐλθὼν ἐπὶ τὰς ὑποστάσεις, οὐ δύναμαι ἀφελεῖν ἀπὸ \mathring{M} $\bar{\beta}$ τὸν $\Xi \bar{\alpha}$ τουτέστι τὰς \mathring{M} ρι $\hat{\beta}$ · θέλω οὖν τὸν Ξ εὐρεθῆναι ἐλάττονα \mathring{M} $\bar{\beta}$, ὤστε καὶ $\Xi \bar{\varsigma}$ \mathring{M} δ ἐλάσσονες ἔσονται \mathring{M} $\bar{\imath}\bar{\varsigma}$. ἐὰν γὰρ ἡ δυὰς ἐπὶ $\Xi \bar{\varsigma}$ γένηται καὶ προσλάβη \mathring{M} $\bar{\delta}$, ποιεῖ \mathring{M} $\bar{\imath}\bar{\varsigma}$.

'Επεὶ οὖν ζητῶ $\mathbf{S} \bar{\eta} \, \mathring{\mathbf{M}} \, \delta$ ἴσ. \square^{φ} καὶ $\mathbf{S} \bar{\mathbf{S}} \, \mathring{\mathbf{M}} \, \delta$ ἴσ. \square^{φ} , ἀλλὰ καὶ ὁ ἀπὸ τῆς δυάδος, τουτέστι $\mathring{\mathbf{M}} \, \delta$, \square^{δ_5} ἐστι, γεγόνασι τρεῖς \square°_4} , $\mathbf{S} \bar{\eta} \, \mathring{\mathbf{M}} \, \delta$, καὶ $\mathbf{S} \bar{\mathbf{S}} \, \mathring{\mathbf{M}} \, \delta$, καὶ $\mathring{\mathbf{M}} \, \delta$, καὶ τοῦ μέσου καὶ τοῦ ἐλαχίστου γον μέρος ἐστίν. ἀπῆκται οὖν μοι εἰς τὸ εὐρεῖν $\langle \tauρεῖs \rangle^1$ τετραγώνους, ὅπως $\mathring{\eta}$ ὑπεροχ $\mathring{\eta}$ τοῦ μείζονος καὶ τοῦ μέσου τῆς ὑπεροχ $\mathring{\eta}$ ς τοῦ μέσου καὶ τοῦ ἐλαχίστου γον μέρος $\mathring{\eta}$, ἔτι δὲ ὁ μὲν ἐλάχιστος $\mathring{\mathring{\eta}} \, \mathring{\mathbf{M}} \, \delta$, ὁ δὲ μέσος ἐλάσσων $\mathring{\mathbf{M}} \, \iota \bar{\mathbf{S}} \, .$

1 τρεῖς add. Bachet.

$$8x + 4 = (p + q)^2,$$

$$6x+4=(p-q)^2$$

on subtracting.

$$2x = 4pq$$
.

Substituting $2p = \frac{1}{2}x$, 2q = 4 (i.e., $p = \frac{1}{4}x$, q = 2) in the first equation we get

 $8x+4=(\frac{1}{4}x+2)^2$,

or

 $112x = x^2$

whence

x = 112.

528

⁴ If we put

I form two numbers whose product is 2x, according to what we know about a double equation; let them be $\frac{1}{2}x$ and 4; and therefore $x=112.^a$ But, returning to the conditions, I cannot subtract x, that is 112, from 2; I desire, then, that x be found <2, so that 6x+4<16. For $2\cdot 6+4=16$.

Then since I seek to make 8x+4=a square, and 6x+4=a square, while $2 \cdot 2=4$ is a square, there are three squares, 8x+4, 6x+4, and 4, and the difference of the greatest and the middle is one-third b of the difference of the middle and least. My problem therefore resolves itself into finding three squares such that the difference of the greatest and the middle is one-third of the difference of the middle and least, and further such that the least =4 and the middle <16.

This method of solving such equations is explicitly given by Diophantus in ii. 11, Dioph. ed. Tannery i. 96. 8-14: ἔσται ἄρα ὁ μὲν $\mathfrak F \bar a \mathring M \ddot \beta$, ὁ δὲ $\mathfrak F \bar a \mathring M \ddot \gamma$, ἴσ. \square · καὶ τοῦτο τὸ εἶδος καλεῖται διπλοϊσότης: ἰσοῦται δὲ τὸν τρόπον τοῦτον. ἰδὼν τὴν ὑπεροχήν, ζήτει δύο ἀρυθμοὺς ἴνα τὸ ὑπ' αὐτῶν ποιῆ τὴν ὑπεροχήν εἰαὶ δὲ $\mathring M \delta$ καὶ $\mathring M^{\circ\varsigma} \delta^{\varkappa}$. τούτων ἤτοι τῆς ὑπεροχῆς τὸ $\mathcal L'$ ἐψ' ἐαυτὸ ἴσον ἐστὶ τῷ ἐλάσσονι, ἢ τῆς συνθέσεως τὸ $\mathcal L'$ ἐψ' ἐαυτὸ ἴσον τῷ μείζονι—'' The equations will then be x+2=a square, x+3=a square; and this species is called a double equation. It is solved in this manner: observe the difference, and seek two [suitable] numbers whose product is equal to the difference; they are 4 and $\frac{1}{4}$. Then, either the square of half the difference of these numbers is equated to the lesser, or the square of half the squa

b The ratio of the differences in this subordinate problem has, of course, nothing to do with the ratio of the differences in the main problem: the fact that they are reciprocals may

lead the casual reader to suspect an error.

Τετάχθω ὁ μὲν ἐλάχιστος Μ΄ δ, ἡ δὲ τοῦ μέσου π^{λ} Sa Μ΄ $\bar{\beta}$ · αὐτὸς ἄρα ἔσται ὁ \Box^{os} , Δ^{v} \bar{a} Sa Μ΄ δ. Έπεὶ οὖν ἡ ὑπεροχὴ τοῦ μείζονος καὶ τοῦ μέσου τῆς ὑπεροχῆς τοῦ μέσου καὶ τοῦ ἐλαχίστου γ^{ov} μέρος ἐστίν, καὶ ἔστιν ἡ ὑπεροχὴ τοῦ μέσου καὶ τοῦ ἐλαχίστου Δ^{v} \bar{a} Sa, ὤστε ἡ ὑπεροχὴ τοῦ ἐλαχίστου Δ^{v} \bar{a} \bar{a} , ὤστε ἡ ὑπεροχὴ τοῦ τοῦ ἐλαχίστου \bar{a} \bar{a}

"Έτι δὲ θέλω τὸν μέσον τετράγωνον ἐλάσσονα εἶναι Μ΄ $\overline{\iota}$ ς, καὶ τὴν πλ. δηλαδὴ ἐλάσσονος Μ΄ δ. ή δὲ πλευρὰ τοῦ μέσου ἐστὶν \mathfrak{S} $\overline{\mathfrak{M}}$ $\overline{\mathfrak{h}}$. ἐλάττονές εἰσι Μ΄ $\overline{\mathfrak{h}}$. καὶ κοινῶν ἀφαιρεθεισῶν τῶν $\overline{\mathfrak{h}}$ $\overline{\mathfrak{M}}$, δ

5 ἔσται ἐλάσσονος Μ΄ $ar{eta}$.

Γέγονεν οὖν μοι Δ^{V} $\tilde{\gamma}$ $\tilde{\Sigma}$ $i\tilde{\beta}$ M $\tilde{\theta}$ $i\sigma$. ποιῆσαι \Box^{ψ} . πλάσσω $\Box^{\delta v}$ τινα ἀπὸ M $\tilde{\gamma}$ λειπουσῶν $\tilde{\Sigma}$ τινας καὶ γίνεται ὁ $\tilde{\Sigma}$ $\tilde{\epsilon}$ κ τινος ἀριθμοῦ $\tilde{\epsilon}$ $\tilde{\epsilon}$ κ γενομένου καὶ προσλαβόντος τὸν $i\beta$, τουτέστι τῆς ισώσεως τῆς $\tilde{\Sigma}$ $i\tilde{\beta}$, καὶ μερισθέντος εἰς τὴν ὑπεροχὴν $\tilde{\eta}$ ὑπερέχει ὁ ἀπὸ τοῦ ἀριθμοῦ \Box^{κ} τῶν $\Delta^{\tilde{\lambda}}$ τῶν έν τῆ ισώσει $\tilde{\gamma}$. ἀπῆκται οὖν μοι εἰς τὸ εὐρεῖν τινα ἀριθμόν, δς $\tilde{\epsilon}^{\kappa i}$ ς γενόμενος καὶ προσλαβών \tilde{M} $i\tilde{\beta}$ καὶ μεριζόμενος εἰς τὴν ὑπεροχὴν $\tilde{\eta}$ ὑπερέχει ὁ ἀπὸ τοῦ αὐτοῦ $\Box^{\kappa i}$ ς τριάδος, ποιεῖ τὴν παραβολὴν ἐλάσσονος \tilde{M} $\tilde{\beta}$.

Let the least be taken as 4, and the side of the middle as z+2; then the square is z^2+4z+4 .

Then since the difference of the greatest and the middle is one-third of the difference of the middle and the least, and the difference of the middle and the least is $z^2 + 4z$, so that the difference of the greatest and the least is $\frac{1}{3}z^2 + 1\frac{1}{3}z$, while the middle term is $z^2 + 4z + 4$, therefore the greatest term $= 1\frac{1}{3}z^2 + 5\frac{1}{3}z + 4 = a$ square. Multiply throughout by 9:

$$12z^2 + 48z + 36 = a$$
 square;

and take the fourth part:

$$3z^2 + 12z + 9 = a$$
 square.

Further, I desire that the middle square <16, whence clearly its side <4. But the side of the middle square is z+2, and so z+2<4. Take away 2 from each side, and z<2.

My equation is now

$$3z^2 + 12z + 9 = a \text{ square.}$$

= $(mz - 3)^2$, say.^a
 $z = \frac{6m + 12}{m^2 - 3}$,

Then

and the equation to which my problem is now resolved is

$$\frac{6m+12}{m^2-3} < 2,$$
<\frac{2}{1}.

ı.e.,

^a As a literal translation of the Greek at this point would be intolerably prolix, I have made free use of modern notation.

^a This is not strictly true. But since $\sqrt{45}$ lies between 6 and 7, no smaller integral value than 7 will satisfy the conditions of the problem.

The inequality will be preserved when the term are cross-multiplied,

i.e.,
$$(6m+12) \cdot 1 < 2 \cdot (m^2-3)$$
;
i.e., $6m+12 < 2m^2-6$.

By adding 6 to both sides,

$$6m + 18 < 2m^2$$
.

When we solve such an equation, we multiply half the coefficient of x [or m] into itself—getting 9; then multiply the coefficient of x^2 into the units -2.18=36; add this last number to the 9—getting 45; take the square root—which is 47^a ; add half the coefficient of x—making a number 40; and divide the result by the coefficient of x^2 —getting a number 45.b

My equation is therefore

$$3z^2 + 12z + 9 = a$$
 square on side $(3 - 5z)$,

and

$$z = \frac{42}{22} = \frac{21}{11}$$

I have made the side of the middle square to be

^b This shows that Diophantus had a perfectly general formula for solving the equation

$$ax^2 = bx + c,$$

namely

$$x = \frac{\frac{1}{2}b + \sqrt{\frac{1}{4}b^2 + ac}}{a}$$
.

From vi. 6 it becomes clear that he had a similar general formula for solving

$$ax^2 + bx = c,$$

and from v. 10 and vi. 22 it may be inferred that he had a general solution for

$$ax^2 + c = bx$$
.

 $\overset{\epsilon}{\epsilon}$ σται $\overset{\epsilon}{\eta}$ το \hat{v} $\square^{\circ v}$ π^{λ} . $\overset{\Lambda}{M}^{\iota a}_{\mu \gamma}$. $a\mathring{v}$ τ $\overset{\delta}{\circ}_{S}$ $\overset{\delta}{\circ}_{S}$ $\overset{\delta}{\circ}$ $\overset{\circ}{\square}^{\circ q}$ $\overset{\Lambda}{\underset{\iota a \omega \mu \theta}{\wedge}}$.

"Ερχομαι οὖν ἐπὶ τὸ ἐξ ἀρχῆς καὶ τάσσω $\mathring{\mathbf{M}}$ ρκα $_{\alpha\omega\mu\theta}$, ὅντα $_{\Box}^{\circ\nu}$, ἴσ. τοῖς $5\overline{\varsigma}\,\mathring{\mathbf{M}}\,\bar{\delta}$ · καὶ πάντα εἰς $\overline{\rho\kappa a}$ · καὶ γίνεται ὁ $5\overline{}\,\overset{\psi\kappa\varsigma}{}$, καὶ ἔστιν ἐλάσσων δυάδος.

'Επὶ τὰς ὑποστάσεις τοῦ προβλήματος τοῦ ἐξ ἀρχῆς· ὑπέστημεν δὴ τὸν μὲν μέσον $\mathfrak{S}\,\bar{a}\,\mathring{M}\,\bar{\beta}$, τὸν δὲ ἐλάχιστον $\mathring{M}\,\bar{\beta}\,\mathring{\Lambda}\,\mathfrak{S}\,\bar{a}$, τὸν δὲ μέγιστον $\mathfrak{S}\,\bar{\zeta}\,\mathring{M}\,\bar{\beta}$. ἔσται ὁ μὲν μέγιστος \overline{a} . αζ, ὁ δὲ βος $\overline{\beta}$ ωιζ, ὁ δὲ ἐλάχιστος ὁ γος $\overline{\pi}$ ζ. καὶ ἐπεὶ τὸ μόριον, ἔστι τὸ $\overline{\psi}$ κ \mathfrak{S}^{ov} , οὐκ ἔστιν \Box^{os} , \mathfrak{S}^{ov} δέ ἐστιν αὐτοῦ, ἐὰν λάβωμεν $\overline{\rho}$ κα, ὅ ἐστι \Box^{os} , πάντων οὖν τὸ \mathfrak{S}^{ov} , καὶ ὁμοίως ἔσται ὁ μὲν \mathfrak{a}^{os} $\overline{\rho}$ κ \mathfrak{a}^{ov} , $\overline{\alpha}$ ωλδ $\overline{\mathcal{L}}'$, ὁ δὲ $\overline{\beta}^{os}$ $\overline{\psi}$ ξ $\overline{\theta}\,\mathcal{L}'$, ὁ δὲ γος $\overline{\psi}$ ς $\overline{\zeta}$.

Καὶ ἐὰν ἐν δλοκλήροις θέλης ἴνα μὴ τὸ \angle' ἐπιτρέχη, εἰς δα ἔμβαλε. καὶ ἔσται ὁ $a^{\circ\varsigma}$ $^{\upsilon \pi \delta}$, ὁ δὲ $\beta^{\circ\varsigma}$ $^{\upsilon \pi \delta}$, ὁ δὲ $\gamma^{\circ\varsigma}$ $^{\upsilon \pi \delta}$. καὶ ἡ ἀπόδειξις φανερά. 534

z+2; therefore the side will be $\frac{43}{11}$ and the square itself $\frac{1849}{121}$.

I return now to the original problem and make $\frac{1849}{121}$, which is a square, =6x+4. Multiplying by

121 throughout, I get $x = \frac{1365}{726}$, which is <2.

In the conditions of the original problem we made the middle term = x + 2, the least = 2 - x, and the greatest 7x + 2.

Therefore

the greatest =
$$\frac{11007}{726}$$
,
the middle = $\frac{2817}{726}$,
the least = $\frac{87}{726}$

Since the denominator, 726, is not a square, but its sixth part is, if we take 121, which is a square, and divide throughout by 6, then similarly the numbers are

And if you prefer to use integers only, avoiding the $\frac{1}{2}$, multiply throughout by 4. Then the numbers will be

And the proof is obvious.

(iii.) Simultaneous Equations Leading to a Quadratic

Ibid. i. 28, Dioph. ed. Tannery i. 62. 20-64. 10

Εύρεῖν δύο ἀριθμοὺς ὅπως καὶ ἡ σύνθεσις αὐτῶν καὶ ἡ σύνθεσις τῶν ἀπ' αὐτῶν τετραγώνων ποιῆ δοθέντας ἀριθμούς.

Δεί δη τους δις ἀπ' αὐτῶν τετραγώνους τοῦ ἀπὸ συναμφοτέρου αὐτῶν τετραγώνου ὑπερέχειν τετρα-

γώνω. ἔστι δὲ καὶ τοῦτο πλασματικόν.

Έπιτετάχθω δὴ τὴν μὲν σύνθεσιν αὐτῶν ποιεῖν $\mathring{\mathbf{M}}$ κ, τὴν δὲ σύνθεσιν τῶν ἀπ' αὐτῶν τετραγώνων ποιεῖν $\mathring{\mathbf{M}}$ $\overline{\sigma}$ \overline{n} .

Τετάχθω δὴ ἡ ὑπεροχὴ αὐτῶν $S\overline{\beta}$. καὶ ἔστω ὁ μείζων $S\overline{\alpha}$ καὶ \mathring{M} I, τῶν ἡμίσεων πάλιν τοῦ συνθέματος, ὁ δὲ ἐλάσσων \mathring{M} I Λ S S I καὶ μένει πάλιν τὸ μὲν σύνθεμα αὐτῶν \mathring{M} K, ἡ δὲ ὑπεροχὴ S B.

΄Λοιπόν ἐστι καὶ τὸ σύνθεμα τῶν ἀπ' αὐτῶν τετραγώνων ποιεῖν । Μ΄ $\overline{\sigma}\eta$ · ἀλλὰ τὸ σύνθεμα τῶν ἀπ' αὐτῶν τετραγώνων ποιεῖ Δ^{Υ} $\overline{\beta}$ \mathring{M} $\overline{\sigma}$. ταῦτα ἴσα \mathring{M} $\overline{\sigma}\overline{\eta}$, καὶ γίνεται ὁ Ξ \mathring{M} $\overline{\beta}$.

He says, in effect, let $\xi - \eta = 2x$;

then $\xi = a + x$, $\eta = a - x$,

536

^a In general terms, Diophantus's problem is to solve the simultaneous equations

 $[\]xi + \eta = 2a$ $\xi^2 + \eta^2 = A.$

(iii.) Simultaneous Equations Leading to a Quadratic

Ibid. i. 28, Dioph. ed. Tannery i. 62. 20-64. 10

To find two numbers such that their sum and the sum of their squares are given numbers.^a

It is a necessary condition that double the sum of their squares exceed the square of their sum by a square. This is of the nature of a formula.

Let it be required to make their sum 20 and the

sum of their squares 208.

Let their difference be 2x, and let the greater = x + 10 (again adding half the sum) and the lesser = 10 - x.

Then again their sum is 20 and their difference 2x. It remains to make the sum of their squares 208. But the sum of their squares is $2x^2 + 200$.

Therefore

$$2x^2 + 200 = 208,$$

and

$$x=2$$
.

To return to the hypotheses—the greater=12 and the lesser=8. And these satisfy the conditions of the problem.

and
$$(a+x)^2 + (a-x)^2 = A$$
,
i.e., $2(a^2+x^2) = A$.

A procedure equivalent to the solution of the pair of simultaneous equations $\xi + \eta = 2a$, $\xi \eta = A$, is given in i. 27, and a procedure equivalent to the solution of $\xi - \eta = 2a$, $\xi \eta = A$, in i. 30.

b In other words, $2(\xi^2 + \eta^2) - (\xi + \eta)^2 = a$ square; it is, in fact, $(\xi - \eta)^2$. I have followed Heath in translating ξοτι δέ και τοῦτο πλασματικόν as "this is of the nature of a formula." Tannery evades the difficulty by translating "est et hoc formativum," but Bachet came nearer the mark with his "effictum aliunde." The meaning of πλασματικόν should be "easy to form a mould," i.e. the formula is easy to discover.

(iv.) Cubic Equation a

Ibid. vi. 17, Dioph. ed. Tannery i. 432, 19-434, 22

To find a right-angled triangle such that its area, added to one of the perpendiculars, makes a square, while its perimeter is a cube.

Let its area = x, and let its hypotenuse be some square number minus x, say 16-x.

But since we supposed the area = x, therefore the product of the sides about the right angle = 2x. But 2x can be factorized into x and 2; if, then, we make one of the sides about the right angle = 2, the other = x.

The perimeter then becomes 18, which is not a cube; but 18 is made up of a square [16] +2. It shall be required, therefore, to find a square number which, when 2 is added, shall make a cube, so that the cube shall exceed the square by 2.

Let the side of the square = m + 1 and that of the cube m-1. Then the square $= m^2 + 2m + 1$ and the cube $= m^3 + 3m - 3m^2 - 1$. Now I want the cube to exceed the square by 2. Therefore, by adding 2 to the square,

$$m^2 + 2m + 3 = m^3 + 3m - 3m^2 - 1$$
,

whence

m = 4.

Therefore the side of the square = 5 and that of

⁶ This is the only example of a cubic equation solved by Diophantus. For Archimedes' geometrical solution of a cubic equation, v. supra, pp. 126-163.

κύβου $\mathring{\mathbf{M}}$ $\bar{\gamma}$. αὐτοὶ ἄρα ὁ μὲν $\Box^{os} \mathring{\mathbf{M}}$ $\bar{\kappa \epsilon}$, ὁ δὲ κύβος $\mathring{\mathbf{M}}$ $\bar{\kappa \zeta}$.

^a Diophantus makes no mention of indeterminate equations of the first degree, presumably because he admits 540

the cube=3; and hence the square is 25 and the cube 27.

I now transform the right-angled [triangle], and, assuming its area to be x, I make the hypotenuse = 25 - x; the base remains = 2 and the perpendicular = x.

The condition is still left that the square on the hypotenuse is equal to the sum of the squares on the sides about the right angle;

i.e.,
$$x^2 + 625 - 50x = x^2 + 4$$
, whence $x = \frac{621}{50}$.

This satisfies the conditions.

(d) Indeterminate Equations a

(i.) Indeterminate Equations of the Second Degree

(a) Single Equations

Ibid. ii. 20, Dioph. ed. Tannery i. 114. 11-23

To find two numbers such that the square of either, added to the other, shall make a square.

Let the first be x, and the second 2x + 1, in order that the square on the first, added to the second, may make a square. There remains to be satisfied the condition that the square on the second, added to the first, shall make a square. But the square on the second, added to the first, is $4x^2 + 5x + 1$; and therefore this must be a square.

rational fractional solutions, and the whole point of solving an indeterminate equation of the first degree is to get a solution in integers.

Πλάσσω τὸν $\Box^{\circ \nu}$ ἀπὸ $\mathfrak{S}\,\tilde{\beta}\,\mathbf{\Lambda}\,\mathring{\mathbf{M}}\,\bar{\beta}$ · αὐτὸς ἄρα ἔσται $\Delta^{\mathbf{Y}}\,\tilde{\delta}\,\mathring{\mathbf{M}}\,\bar{\delta}\,\mathbf{\Lambda}\,\mathfrak{S}\,\bar{\eta}$ · καὶ γίνεται ὁ $\mathfrak{S}\,\overset{\imath \gamma}{\gamma}$.

(β) Double Equations

Ibid. iv. 32, Dioph. ed. Tannery 268, 18-272, 15

Δοθέντα ἀριθμὸν διελεῖν εἰς τρεῖς ἀριθμοὺς ὅπως ὁ ὑπὸ τοῦ πρώτου καὶ τοῦ δευτέρου, ἐάν τε προσλάβη τὸν τρίτον, ἐάν τε λείψη, ποιῆ τετράγωνον. "Εστω ὁ δοθεὶς ὁ ξ.

Τετάχθω ὁ γος Ξ ā, καὶ ὁ βος $\mathring{\mathbf{M}}$ ἐλασσόνων τοῦ \vec{s} · ἔστω $\mathring{\mathbf{M}}$ \vec{b} · ὁ ἄρα αος ἔσται $\mathring{\mathbf{M}}$ \vec{b} $\mathring{\mathbf{M}}$ \vec{s} τι καὶ λοιπά ἐστι δύο ἐπιτάγματα, τὸν ὑπὸ αος καὶ βος ἐάν τε προσλάβη τὸν γον, ἐάν τε λείψη, ποιεῖν $\Box^{\circ \nu}$. καὶ γίνεται διπλ $\hat{\eta}$ ή ἰσότης· $\mathring{\mathbf{M}}$ $\vec{\eta}$ $\mathring{\mathbf{M}}$ \vec{s} \vec{a} το. $\Box^{\varphi \cdot}$ καὶ $\mathring{\mathbf{M}}$ $\vec{\eta}$ $\mathring{\mathbf{M}}$ \vec{s} \vec{v} το. $\Box^{\varphi \cdot}$ καὶ οὐ ρητόν

Diophantus does not give a general solution, but takes a number of special cases. In this case A is a square number $(=a^2, say)$, and in the equation

$$a^2x^2 + Bx + C = y^2$$

he apparently puts

$$y^2 = (ax - m)^2,$$

where m is some integer,

$$x = \frac{m^2 - C}{2am + B}$$

whence

^a The problem, in its most general terms, is to solve the equation $Ax^2 + Bx + C = y^2.$

I form the square from 2x-2; it will be $4x^2+4-8x$; and $x=\frac{3}{13}$.

The first number will be $\frac{3}{13}$, the second $\frac{19}{13}$, and they satisfy the conditions of the problem.⁴

(β) Double Equations b

Ibid. iv. 32, Dioph. ed. Tannery 268, 18-272, 15

To divide a given number into three parts such that the product of the first and second \pm the third shall make a square.

Let the given number be 6.

Let the third part be x, and the second part any number <6, say 2; then the first part = 4-x; and the two remaining conditions are that the product of the first and second \pm the third = a square. There results the double equation

$$8-x = a$$
 square,
 $8-3x = a$ square.

And this does not give a rational result since the ratio

b Diophantus's term for a double equation is $\delta\iota\pi\lambda \bar{\sigma}i\sigma \tau \eta_S$, $\delta\iota\pi\lambda \bar{\eta}$ $l\sigma \delta\tau \eta_S$ or $\delta\iota\pi\lambda \bar{\eta}$ $l\sigma \omega \sigma\iota_S$. It always means with him that two different functions of the unknown have to be made simultaneously equal to two squares. The general equations are therefore

$$A_1x^2 + B_1x + C_1 = u_1^2$$
,
 $A_2x^2 + B_2x + C_2 = u_2^2$.

Diophantus solves several examples in which the terms in x^2 are missing, and also several forms of the general equation.

of the coefficients of x is not the ratio of a square to a square.

But the coefficient 1 of x is 2-1 and the coefficient 3 of x likewise is 2+1; therefore my problem resolves itself into finding a number to take the place of 2 such that (the number +1) bears to (the number -1) the same ratio as a square to a square.

Let the number sought be y; then (the number +1) = y +1, and (the number -1) = y -1. We require these to have the ratio of a square to a square, say 4:1. Now (y-1). 4 = 4y - 4 and (y+1). 1 = y + 1. And these are the numbers having the ratio of a square to a square. Now I put

$$4y - 4 = y + 1$$

$$y = \frac{5}{6}$$

giving

Therefore I make the second part $\frac{5}{3}$, for the

third = x; and therefore the first = $\frac{13}{2} - x$.

There remains the condition, that the product of the first and second \pm the third = a square. But the product of the first and second + the third =

$$\frac{65}{9} - \frac{2}{3}x = a$$
 square,

and the product of the first and second - the third =

$$\frac{65}{9} - 2\frac{2}{3}x = a$$
 square.

a These are a pair of equations of the form

$$am^2x + a = u^2,$$
$$an^2x + b = v^2.$$

Multiply by n^2 , m^2 respectively, getting, say

$$am^2n^2x + an^2 = u'^2,$$

 $am^2n^2x + bm^2 = v'^2.$

$$an^2 - bm^2 = u'^2 - v'^2$$

Let
$$an^2 - bm^2 = pq$$
.

and put
$$u' + v' = p$$
,

$$u'-v'=q$$
:

$$u'^2 = \frac{1}{4}(p+q)^2, \ v'^2 = \frac{1}{4}(p-q)^2,$$

and so
$$am^2n^2x + an^2 = \frac{1}{4}(p+q)^2,$$

$$am^2n^2x + bm^2 = \frac{1}{4}(p-q)^2$$
;

whence, from either,

$$x = \frac{\frac{1}{4}(p^2 + q^2) - \frac{1}{2}(an^2 + bm^2)}{am^2n^2}.$$

٠.

Multiply throughout by 9, getting

$$65 - 6x = a \text{ square}$$

and

$$65 - 24x = a \text{ square.}^a$$

Equating the coefficients of x by multiplying the first equation by 4, I get

$$260 - 24x = a \text{ square}$$

and

$$65 - 24x = a$$
 square

Now I take their difference, which is 195, and split it into the two factors 15 and 13. Squaring the half of their difference, and equating the result to the lesser square, I get $x = \frac{8}{a}$.

Returning to the conditions—the first part will be $\frac{5}{3}$, the second $\frac{5}{3}$, and the third $\frac{8}{3}$. And the proof is obvious.

$$p = 15, q = 13,$$

$$\{\frac{1}{2}(15-13)^2=65-24x,$$

whence

and

$$24x = 64$$
, and $x = \frac{8}{3}$.

This is the procedure indicated by Diophantus. In his example,

 $A_0x^6 + A_1x^5 + \dots + A_6 = y^2 \text{ or } y^3.$

Diophantus solves a number of special cases of different degrees.

In double equations, one expression is made equal to a 548

^a As with equations of the second degree, these may be single or double. Single equations always take the form that an expression in x, of a degree not exceeding the sixth, is to be made equal to a square or cube. The general form is therefore

(ii.) Indeterminate Equations of Higher Degree a

Ibid. iv. 18, Dioph. ed. Tannery i. 226. 2-228. 5

To find two numbers such that the cube of the first added to the second shall make a cube, and the square of the second added to the first shall make a square.

Let the first number be x. Then the second will be a cube number less x^3 , say $8-x^3$. And the cube of the first, added to the second, makes a cube.

There remains the condition that the square on the second, added to the first, shall make a square. But the square on the second, added to the first, is $x^6 + x + 64 - 16x^3$. Let this be equal to $(x^3 + 8)^2$, that is to $x^6 + 16x^3 + 64.$ Then, by adding or subtracting like terms,

$$32x^3 = x$$
;

and, after dividing by x,

$$32x^2 = 1.$$

Now 1 is a square, and if $32x^2$ were a square, my equation would be soluble. But $32x^2$ is formed from $2 \cdot 16x^3$, and $16x^3$ is $(2 \cdot 8)(x^3)$, that is, it is formed

cube and the other to a square, but only a few simple cases are solved by Diophantus.

b The general type of the equation is

$$x^6 - \Lambda x^3 + Bx + c^2 = y^2$$
.

Put
$$y = x^3 + c$$
, then

$$x^2 = \frac{B}{\sqrt{x^2c^2}}$$

and if the right-hand expression is a square, there is a rational solution.

In the case of the equation $x^6 - 16x^3 - x + 64 = y^2$ it is not a square, and Diophantus replaces the equation by another, $x^6 - 128x^3 + x + 4096 = y^2$, in which it is a square.

(e) Theory of Numbers: Sums of Squares Ibid. ii. 8, Dioph. ed. Tannery i. 90, 9-21

Τον επιταχθέντα τετράγωνον διελείν είς δύο τετραγώνους.

It was on this proposition that Fermat wrote a famous note: "On the other hand, it is impossible to separate a cube into two cubes, or a biquadrate into two biquadrates, or generally any power except a square into two powers with the same exponent. I have discovered a truly marvellous proof of this, which, however, the margin is not large enough 550

from 2.8. Therefore $32x^2$ is formed from 4.8. My problem therefore becomes to find a cube which, when multiplied by 4, makes a square.

Let the number sought be y^3 . Then $4y^3 = a$ square $= 16y^2$ say; whence y = 1. Returning to the con-

ditions—the cube will be 64.

I therefore take the second number as $61-x^3$. There remains the condition that the square on the second added to the first shall make a square. But the square on the second added to the first =

$$x^6 + 4096 + x - 128x^3 =$$
a square
= $(x^3 - 64)^2$, say,
= $x^6 - 4096 + 128x^3$.

On taking away the common terms,

 $256x^3 = x,$ $x = \frac{1}{16}.$

and

Returning to the conditions-

first number =
$$\frac{1}{16}$$
, second number = $\frac{262143}{1096}$.

(e) Theory of Numbers: Sums of Squares *Ibid.* ii. 8, Dioph. ed. Tannery ii. 90, 9-21

To divide a given square number into two squares.4

to contain." Fermat claimed, in other words, to have proved that $z^m + y^m = z^m$ cannot be solved in rational numbers if m > 2. Despite the efforts of many great mathematicians, a proof of this general theorem is still lacking.

Fermat's notes, which established the modern Theory of Numbers, were published in 1670 in Bachet's second edition

of the works of Diophantus.

^a The method has been explained in v. 19, where it is proposed to divide 13 into two squares each>6. It will be sufficiently obvious from this example. The method is also used in v. 10, 12, 13, 14.

Then it is required to divide 10 into three squares such that each of them>3. If then we divide 10 into three squares, according to the method of approximation, a each of them will be>3 and, by taking 3 from each, we shall be able to obtain the parts into which unity is to be divided.

We take, therefore, the third part of 10, which is $3\frac{1}{3}$, and try by adding some square part to $3\frac{1}{3}$ to make a square. On multiplying throughout by 9, it is required to add to 30 some square part which will make the whole a square.

Let the added part be $\frac{1}{x^2}$; multiply throughout by x^2 ; then

 $30x^2 + 1 = a \text{ square.}$

Let the root be 5x + 1; then, squaring,

$$25x^2 + 10x + 1 = 30x^2 + 1$$
;

whence

$$x=2, x^2=4, \frac{1}{x^2}=\frac{1}{4}$$

If, then, to 30 there be added $\frac{1}{4}$, to $3\frac{1}{3}$ there is added $\frac{1}{36}$, and the result is $\frac{121}{36}$. It is therefore required to divide 10 into three squares such that the side of each shall approximate to $\frac{11}{6}$.

But 10 is composed of two squares, 9 and 1. We divide 1 into two squares, $\frac{9}{25}$ and $\frac{16}{25}$, so that 10 is composed of three squares, 9, $\frac{9}{25}$ and $\frac{16}{25}$. It is there-

Εύρειν τέσσαρας ἀριθμούς (τετραγώνους), οί συντεθέντες καὶ προσλαβόντες τὰς ίδίας πλευράς συντεθείσας ποιοῦσι δοθέντα ἀριθμόν.

a The sides are, in fact, $\frac{1321}{711}$, $\frac{1288}{711}$, $\frac{1285}{711}$, and the squares are 1745041 1658944 1651225 505521 505521 505521 556

fore required to make each of the sides approximate to $\frac{11}{6}$.

But their sides are 3, $\frac{4}{5}$ and $\frac{3}{5}$. Multiply throughout by 30, getting 90, 24 and 18; and $\frac{11}{6}$ [when multiplied by 30] becomes 55. It is therefore required to make each side approximate to 55.

[Now
$$3 > \frac{55}{30}$$
 by $\frac{35}{30}$, $\frac{4}{5} < \frac{55}{30}$ by $\frac{31}{30}$, and $\frac{3}{5} < \frac{55}{30}$ by $\frac{37}{30}$.

If, then, we took the sides of the squares as $3 - \frac{35}{30}$,

 $\frac{4}{5} + \frac{31}{30}, \frac{3}{5} + \frac{37}{30}$, the sum of the squares would be $3 \cdot (\frac{11}{6})^2$

or $\frac{363}{36}$, which > 10.

whence

Therefore] we take the side of the first square as 3-35x, of the second as $\frac{4}{5}+31x$, and of the third as

 $\frac{3}{5}$ +37x. The sum of the aforesaid squares

$$3555x^{2} + 10 - 116x = 10;$$
$$x = \frac{116}{3555}.$$

Returning to the conditions—as the sides of the squares are given, the squares themselves are also given. The rest is obvious.^a

Let it be 12.

Since any square added to its own side and $\frac{1}{4}$ makes a square, whose side minus $\frac{1}{2}$ is the number which is the side of the original square, and the four numbers added to their own sides make 12, then if we add $4 \cdot \frac{1}{4}$ they will make four squares. But

$$12 + 4 \cdot \frac{1}{4}$$
 (or 1) = 13.

Therefore it is required to divide 13 into four squares, and then, if I subtract $\frac{1}{2}$ from each of their sides, I shall have the sides of the four squares.

Now 13 may be divided into two squares, 4 and 9. And again, each of these may be divided into two

squares,
$$\frac{64}{25}$$
 and $\frac{36}{25}$, and $\frac{144}{25}$ and $\frac{81}{25}$. I take the side

of each $\frac{8}{5}$, $\frac{6}{5}$, $\frac{12}{5}$, $\frac{9}{5}$, and subtract half from each side, and the sides of the required squares will be

$$\frac{11}{10}$$
, $\frac{7}{10}$, $\frac{19}{10}$, $\frac{13}{10}$

The squares themselves are therefore respectively

$$\frac{121}{100}$$
, $\frac{49}{100}$, $\frac{361}{100}$, $\frac{169}{100}$

a i.e., $x^2 + x + \frac{1}{4} = (x + \frac{1}{2})^2$.

b In iv. 30 and v. 14 it is also required to divide a number into four squares. As every number is either a square or the sum of two, three or four squares (a theorem stated by Fermat and proved by Lagrange), and a square can always be divided into two squares, it follows that any number can be divided into four squares. It is not known whether Diophantus was aware of this.

(f) POLYGONAL NUMBERS

Dioph. De polyg. num., Praef., Dioph. ed. Tannery i. 450, 3-19

Έκαστος τῶν ἀπὸ τῆς τριάδος ἀριθμῶν αὐξομένων μονάδι, πολύγωνός ἐστι πρῶτος ἀπὸ τῆς μονάδος, καὶ ἔχει γωνίας τοσαύτας ὅσον ἐστὶν τὸ πλῆθος τῶν ἐν αὐτῷ μονάδων πλευρά τε αὐτοῦ ἐστιν ὁ ἑξῆς τῆς μονάδος ἀριθμός, ὁ $\bar{\beta}$. ἔσται δὲ ὁ μὲν $\bar{\gamma}$ τρίγωνος, ὁ δὲ δ τετράγωνος, ὁ δὲ $\bar{\epsilon}$

πεντάγωνος, καὶ τοῦτο έξῆς.

Τῶν δὴ τετραγώνων προδήλων ὅντων ὅτι καθεστήκασι τετράγωνοι διὰ τὸ γεγονέναι αὐτοὺς ἐξ ἀριθμοῦ τινος ἐφ' ἐαυτὸν πολλαπλασιασθέντος, ἐδοκιμάσθη ἔκαστον τῶν πολυγώνων, πολυπλασιαζόμενον ἐπί τινα ἀριθμὸν κατὰ τὴν ἀναλογίαν τοῦ πλήθους τῶν γωνιῶν αὐτοῦ, καὶ προσλαβόντα τετράγωνόν τινα πάλιν κατὰ τὴν ἀναλογίαν τοῦ πλήθους τῶν γωνιῶν αὐτῶν, φαίνεσθαι τετράγωνον ὁ δὴ παραστήσομεν ὑποδείξαντες πῶς ἀπὸ δοθείσης πλευρᾶς ὁ ἐπιταχθεὶς πολύγωνος εὐρίσκεται, καὶ πῶς δοθέντι πολυγώνω ἡ πλευρὰ λαμβάνεται.

1 πρῶτος Bachet, πρῶτον codd.

^a A fragment of the tract *On Polygonal Numbers* is the only work by Diophantus to have survived with the *Arithmetica*. The main fact established in it is that stated in Hypsicles' definition, that the a-gonal number of side n is

(f) POLYGONAL NUMBERS a

Diophantus, On Polygonal Numbers, Preface, Dioph. ed. Tannery i. 450. 3-19

From 3 onwards, every member of the series of natural numbers increasing by unity is the first (after unity) of a particular species of polygon, and it has as many angles as there are units in it; its side is the number next in order after the unit, that is, 2. Thus 3 will be a triangle, 4 a square, 5 a pentagon, and so on in order.^b

In the case of squares, it is clear that they are squares because they are formed by the multiplication of a number into itself. Similarly it was thought that any polygon, when multiplied by a certain number depending on the number of its angles, with the addition of a certain square also depending on the number of its angles, would also be a square. This we shall establish, showing how any assigned polygonal number may be found from a given side. and how the side may be calculated from a given polygonal number.

 $\frac{1}{2}n\{2+(n-1)(a-2)\}\$ (v. supra, p. 396 n. a, and vol. i. p. 98 n. a). The method of proof contrasts with that of the Arithmetica in being geometrical. For polygonal numbers, v. vol. i. pp. 86-99.

b The meaning is explained in vol. i. p. 86 n. a, especially in the diagram on p. 89. In the example there given, 5 is the first (after unity) of the series of pentagonal numbers 1, 5, 12, 22 . . . It has 5 angles, and each side joins 2 units.

XXIV. REVIVAL OF GEOMETRY: PAPPUS OF ALEXANDRIA

XXIV. REVIVAL OF GEOMETRY: PAPPUS OF ALEXANDRIA

(a) GENERAL

Suidas, s.v. Πάππος

Πάππος, 'Αλεξανδρεύς, φιλόσοφος, γεγονώς κατὰ τὸν πρεσβύτερον Θεοδόσιον τὸν βασιλέα, ὅτε καὶ Θέων ὁ φιλόσοφος ἤκμαζεν, ὁ γράψας εἰς τὸν Πτολεμαίον Κανόνα. βιβλία δὲ αὐτοῦ Χωρογραφία οἰκουμενική, Εἰς τὰ δ βιβλία τῆς Πτολεμαίου

^a Theodosius I reigned from A.D. 379 to 395, but Suidas may have made a mistake over the date. A marginal note opposite the entry *Diocletian* in a Leyden Ms. of chronological tables by Theon of Alexandria says, "In his time Pappus wrote"; Diocletian reigned from A.D. 284 to 305. In Rome's edition of Pappus's commentary on Ptolemy's *Syntaxis* (*Studi e Testi*, liv. pp. x-xiii), a cogent argument is given for believing that Pappus actually wrote his *Collection* about A.D. 320.

Suidas obviously had a most imperfect knowledge of Pappus, as he does not mention his greatest work, the Synagoge or Collection. It is a handbook to the whole of Greek geometry, and is now our sole source for much of the history of that science. The first book and half of the second are missing. The remainder of the second book gives an account of Apollonius's method of working with large numbers (v. supra, pp. 352-357). The nature of the remaining books to the eighth will be indicated by the passages here cited. There is some evidence (v. infra, p. 607 n. a) that the work was originally in twelve books.

The edition of the Collection with ancillary material published in three volumes by Friedrich Hultsch (Berlin, 1876-

XXIV. REVIVAL OF GEOMETRY: PAPPUS OF ALEXANDRIA

(a) GENERAL

Suidas, s.v. Pappus

Pappus, an Alexandrian, a philosopher, born in the time of the Emperor Theodosius I, when Theon the philosopher also flourished,^a who commented on Ptolemy's Table. His works include a Universal Geography, a Commentary on the Four Books of

1878) was a notable event in the revival of Greek mathematical studies. The editor's only major fault is one which he shares with his generation, a tendency to condemn

on slender grounds passages as interpolated.

Pappus also wrote a commentary on Euclid's *Elements*; fragments on Book x. are believed to survive in Arabic (v. vol. i. p. 456 n. a). A commentary by Pappus on Euclid's *Data* is referred to in Marinus's commentary on that work. Pappus (v. vol. i. p. 301) himself refers to his commentary on the *Analemma* of Diodorus. The Arabic Fihrist says that

he commented on Ptolemy's Planisphaerium.

The separate books of the Collection were divided by Pappus himself into numbered sections, generally preceded by a preface, and the editors have also divided the books into chapters. References to the Collection in the selections here given (e.g., Coll. iii. 11. 28, ed. Hultsch 68. 17-70. 8) are first to the book, then to the number or preface in Pappus's division, then to the chapter in the editors' division, and finally to the page and line of Hultsch's edition. In the selections from Book vii. Pappus's own divisions are omitted as they are too complicated, but in the collection of lemmas the numbers of the propositions in Hultsch's edition are added as these are often cited.

Μεγάλης συντάξεως υπόμνημα, Ποταμούς τους έν Λιβύη, 'Ονειροκριτικά.

(b) PROBLEMS AND THEOREMS

Papp. Coll. iii., Praef. 1, ed. Hultsch 30. 3-32. 3

Οί τὰ ἐν γεωμετρία ζητούμενα βουλόμενοι τεχνικώτερον διακρίνειν, ώ κράτιστε Πανδροσίον, ποόβλημα μεν άξιοῦσι καλεῖν ἐφ' οὖ προβάλλεταί τι ποιήσαι καὶ κατασκευάσαι, θεώρημα δὲ ἐν ὧ τινών ὑποκειμένων τὸ ἐπόμενον αὐτοῖς καὶ πάντως έπισυμβαίνον θεωρείται, των παλαιών των μέν προβλήματα πάντα, των δε θεωρήματα είναι φασκόντων. ὁ μὲν οὖν τὸ θεώρημα προτείνων, συνιδών όντινοῦν τρόπον, τὸ ἀκόλουθον τούτω άξιοι ζητείν και οὐκ αν άλλως ύγιως προτείνοι, ό δὲ τὸ πρόβλημα προτείνων [ἂν μὲν ἀμαθὴς ἦ καὶ παντάπασιν ιδιώτης], καν αδύνατόν πως κατασκευασθήναι προστάξη, σύγγνωστός έστιν καὶ ἀνυπεύθυνος. τοῦ γὰρ ζητοῦντος ἔργον καὶ τοῦτο διορίσαι, τό τε δυνατὸν καὶ τὸ ἀδύνατον, καν ή δυνατόν, πότε καὶ πῶς καὶ ποσαχῶς δυνατόν. έὰν δὲ προσποιούμενος ἢ τὰ μαθήματά πως απείρως προβάλλων, οὐκ ἔστιν αἰτίας ἔξω. πρώην γοῦν τινες τῶν τὰ μαθήματα προσποιουμένων , εἰδέναι διὰ σοῦ τὰς τῶν προβλημάτων προτάσεις ἀμαθῶς ἡμῖν ὥρισαν. περὶ ὧν ἔδει καὶ τῶν

¹ αν . . . ιδιώτης om. Hultsch.

^a Suidas seems to be confusing l'tolemy's Μαθηματική τετράβιβλος σύνταξις (Tetrabiblos or Quadripartitum) which was in four books but on which Pappus did not comment, with the Μαθηματική σύνταξις (Syntaxis or Almagest), which was the subject of a commentary by Pappus but extended to 566

Ptolemy's Great Collection,^a The Rivers of Libya, On the Interpretation of Dreams.

(b) PROBLEMS AND THEOREMS

Pappus, Collection iii., Preface 1, ed. Hultsch 30. 3-32. 3

Those who favour a more exact terminology in the subjects studied in geometry, most excellent Pandrosion, use the term problem to mean an inquiry in which it is proposed to do or to construct something, and the term theorem an inquiry in which the consequences and necessary implications of certain hypotheses are investigated, but among the ancients some described them all as problems, some as theorems. Therefore he who propounds a theorem, no matter how he has become aware of it, must set for investigation the conclusion inherent in the premises, and in no other way would he correctly propound the theorem; but he who propounds a problem, even though he may require us to construct something which is in some way impossible, is free from blame and criticism. For it is part of the investigator's task to determine the conditions under which a problem is possible and impossible, and, if possible, when, how and in how many ways it is possible. But when a man professing to know mathematics sets an investigation wrongly he is not free from censure. For example, some persons professing to have learnt mathematics from you lately gave me a wrong enunciation of problems. It is desirable that I should state some of the proofs of

thirteen books. Pappus's commentary now survives only for Books v. and vi., which have been edited by A. Rome, Studi e Testi, liv., but it certainly covered the first six books and possibly all thirteen.

παραπλησίων αὐτοῖς ἀποδείξεις τινὰς ἡμᾶς εἰπεῖν εἰς ἀφέλειαν σήν τε καὶ τῶν φιλομαθούντων ἐν τῷ τρίτῳ τούτῳ τῆς Συναγωγῆς βιβλίῳ. τὸ μὲν οὖν πρῶτον τῶν προβλημάτων μέγας τις γεωμέτης εἶναι δοκῶν ὥρισεν ἀμαθῶς. τὸ γὰρ δύο δοθεισῶν εὐθειῶν δύο μέσας ἀνάλογον ἐν συνεχεῖ ἀναλογίᾳ λαβεῖν ἔφασκεν εἰδέναι δι' ἐπιπέδου θεωρίας, ἡξίου δὲ καὶ ἡμᾶς ὁ ἀνὴρ ἐπισκεψαμένους ἀποκρίνασθαι περὶ τῆς ὑπ' αὐτοῦ γενηθείσης κατασκευῆς, ἤτις ἔχει τὸν τρόπον τοῦτον.

(c) THE THEORY OF MEANS

Ibid. iii. 11. 28, ed. Hultsch 68. 17-70. 8

Τὸ δὲ δεύτερον τῶν προβλημάτων ἦν τόδε·

'Εν ήμικυκλίω τὰς τρεῖς μεσότητας λαβεῖν ἄλλος τις ἔφασκεν, καὶ ἡμικύκλιον τὸ ΑΒΓ ἐκθέμενος, οὖ κέντρον τὸ Ε, καὶ τυχὸν σημεῖον ἐπὶ τῆς ΑΓ λαβών τὸ Δ, καὶ ἀπ' αὐτοῦ πρὸς ὀρθὰς ἀγαγὼν τῆ ΕΓ τὴν ΔΒ, καὶ ἐπιζεύξας τὴν ΕΒ, καὶ αὐτῆ κάθετον ἀγαγὼν ἀπὸ τοῦ Δ τὴν ΔΖ, τὰς τρεῖς μεσότητας ἔλεγεν ἁπλῶς ἐν τῷ ἡμικυκλίῳ ἐκτεθεῖσθαι, τὴν μὲν ΕΓ μέσην ἀριθμητικήν, τὴν δὲ ΔΒ μέσην γεωμετρικήν, τὴν δὲ ΒΖ ἀρμονικήν.

Οτι μὲν οὖν ή $\rm B\Delta$ μέση ἐστὶ $\tau \hat{\omega}$ ν $\rm A\Delta$, $\Delta \Gamma$ ἐν

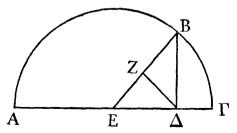

^a The method, as described by Pappus, but not reproduced here, does not actually solve the problem, but it does furnish a series of successive approximations to the solution, and deserves more kindly treatment than it receives from him. 568

these and of matters akin to them, for the benefit both of yourself and of other lovers of this science, in this third book of the *Collection*. Now the first of these problems was set wrongly by a person who was thought to be a great geometer. For, given two straight lines, he claimed to know how to find by plane methods two means in continuous proportion, and he even asked that I should look into the matter and comment on his construction, which is after this manner.^a

(c) The Theory of Means *Ibid.* iii. 11. 28, ed. Hultsch 68. 17-70. 8

The second of the problems was this:

A certain other [geometer] set the problem of exhibiting the three means in a semicircle. Describing a semicircle AB Γ , with centre E, and taking any point Δ on A Γ , and from it drawing Δ B perpendicular to E Γ , and joining EB, and from Δ drawing Δ Z perpendicular to it, he claimed simply that the three means had been set out in the semicircle, E Γ being the arithmetic mean, Δ B the geometric mean and BZ the harmonic mean.

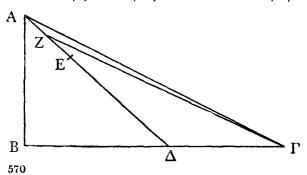

That $B\Delta$ is a mean between $A\Delta$, $\Delta\Gamma$ in geometrical 569

τῆ γεωμετρικῆ ἀναλογία, ἡ δὲ ΕΓ τῶν ΑΔ, ΔΓ ἐν τῆ ἀριθμητικῆ μεσότητι, φανερόν. ἔστι γὰρ ώς μὲν ἡ ΑΔ πρὸς ΔΒ, ἡ ΔΒ πρὸς ΔΓ, ὡς δὲ ἡ ΑΔ πρὸς ἑαυτήν, οὕτως ἡ τῶν ΑΔ, ΑΕ ὑπεροχή, τουτέστιν ἡ τῶν ΑΔ, ΕΓ, πρὸς τὴν τῶν ΕΓ, ΓΔ. πῶς δὲ καὶ ἡ ΖΒ μέση ἐστὶν τῆς ἁρμονικῆς μεσότητος, ἢ ποίων εὐθειῶν, οὐκ εἶπεν, μόνον δὲ ὅτι τρίτη ἀνάλογόν ἐστιν τῶν ΕΒ, ΒΔ, ἀγνοῶν ὅτι ἀπὸ τῶν ΕΒ, ΒΔ, ΒΖ ἐν τῆ γεωμετρικῆ ἀναλογία οὐσῶν πλάσσεται ἡ ἁρμονικὴ μεσότης. δειχθήσεται γὰρ ὑφ' ἡμῶν ὕστερον ὅτι δύο αἱ ΕΒ καὶ τρεῖς αἱ ΔΒ καὶ μία ἡ ΒΖ ὡς μία συντεθεῖσαι ποιοῦσι τὴν μείζονα ἄκραν τῆς ἁρμονικῆς μεσότητος, δύο δὲ αἱ ΒΔ καὶ μία ἡ ΒΖ τὴν μέσην, μία δὲ ἡ ΒΔ καὶ μία ἡ ΒΖ τὴν έλαχίστην.

(d) The Paradoxes of Ervcinus

Ibid. iii. 24. 58, ed. Hultsch 104. 14-106. 9
Τὸ δὲ τρίτον τῶν προβλημάτων ἦν τόδε.
"Έστω τρίγωνον ὀρθογώνιον τὸ ΑΒΓ ὀρθὴν

proportion, and E Γ between A Δ , $\Delta\Gamma$ in arithmetical proportion, is clear. For

$$\begin{array}{ll} A\Delta:\Delta B=\Delta B:\Delta \Gamma, \ [Eucl. \ iii. \ 31, \ vi. \ 8 \ Por. \\ A\Delta:A\Delta=(A\Delta-AE):(E\Gamma-\Gamma\Delta) \\ =(A\Delta-E\Gamma):(E\Gamma-\Gamma\Delta). \end{array}$$

But how ZB is a harmonic mean, or between what kind of lines, he did not say, but only that it is a third proportional to EB, $B\Delta$, not knowing that from EB, $B\Delta$, BZ, which are in geometrical proportion, the harmonic mean is formed. For it will be proved by me later that a harmonic proportion can thus be formed—

greater extreme = $2EB + 3\Delta B + BZ$, mean term = $2B\Delta + BZ$, lesser extreme = $B\Delta + BZ$.

(d) The Paradoxes of Erycinus Ibid. iii. 24. 58, ed. Hultsch 104. 14-106. 9

The third of the problems was this: Let $AB\Gamma$ be a right-angled triangle having the

 $^{\alpha}$ It is Pappus, in fact, who seems to have erred, for BZ is a harmonic mean between AD, $\Delta\Gamma$, as can thus be proved: Since BDE is a right-angled triangle in which ΔZ is perpendicular to BE,

$$\begin{array}{lll} \therefore & \mathrm{BZ}: \mathrm{B}\Delta = \mathrm{B}\Delta: \mathrm{BE}, \\ i.e., & \mathrm{BZ}: \mathrm{BE} = \mathrm{B}\Delta^2 = \mathrm{A}\Delta: \Delta\Gamma, \\ \mathrm{But} & \mathrm{BE} = \frac{1}{2}(\mathrm{A}\Delta + \Delta\Gamma): \\ \therefore & \mathrm{BZ}(\mathrm{A}\Delta + \Delta\Gamma) = 2\mathrm{A}\Delta: \Delta\Gamma, \\ \therefore & \mathrm{A}\Delta(\mathrm{BZ} - \Delta\Gamma) = \Delta\Gamma(\mathrm{A}\Delta - \mathrm{BZ}), \\ i.c., & \mathrm{A}\Delta: \Delta\Gamma = (\mathrm{A}\Delta - \mathrm{BZ}): (\mathrm{BZ} - \Delta\Gamma), \end{array}$$

and \therefore BZ is a harmonic mean between A Δ , $\Delta\Gamma$.

The three means and the several extremes have thus been

έχον τὴν \mathbf{B} γωνίαν, καὶ διήχθω τις ἡ $\mathbf{A}\Delta$, καὶ κείσθω τῆ $\mathbf{A}\mathbf{B}$ ἴση ἡ $\Delta\mathbf{E}$, καὶ δίχα τμηθείσης τῆς $\mathbf{E}\mathbf{A}$ κατὰ τὸ \mathbf{Z} , καὶ ἐπιζευχθείσης τῆς $\mathbf{Z}\Gamma$ δεῖξαι συναμφοτέρας τὰς $\Delta\mathbf{Z}\Gamma$ δύο πλευρὰς ἐντὸς τοῦ τριγώνου μείζονας τῶν ἐκτὸς συναμφοτέρων τῶν $\mathbf{B}\mathbf{A}\Gamma$ πλευρῶν.

Καὶ ἔστι δῆλον. ἐπεὶ γὰρ αἱ ΓΖΑ, τουτέστιν αἱ ΓΖΕ, τῆς ΓΑ μείζονές εἰσιν, ἴση δὲ ἡ Δ Ε τῆ AB, αἱ ΓΖΔ ἄρα δύο τῶν ΓΑΒ μείζονές εἰσιν. . . .

'Αλλ' ὅτι τοῦτο μέν, ὅπως ἄν τις ἐθέλοι προτείνειν, ἀπειραχῶς δείκνυται δῆλον, οὐκ ἄκαιρον δὲ καθολικώτερον περὶ τῶν τοιούτων προβλημάτων διαλαβεῖν ἀπὸ τῶν φερομένων παραδόξων 'Ερυκίνου προτείνοντας οὕτως.

(e) THE REGULAR SOLIDS

Ibid. iii. 40. 75, ed. Hultsch 132. 1-11

Είς τὴν δοθεῖσαν σφαῖραν ἐγγράψαι τὰ πέντε πολύεδρα, προγράφεται δὲ τάδε.

Έστω $\dot{\epsilon}$ ν σφαίρα κύκλος $\dot{\delta}$ ΑΒΓ, οὖ διάμετρος $\dot{\eta}$ ΑΓ καὶ κέντρον τὸ Δ , καὶ προκείσθω $\dot{\epsilon}$ ις τὸν

represented by five straight lines (EB, BZ, A Δ , $\Delta\Gamma$, B Δ). Pappus takes six lines to solve the problem. He proceeds to define the seven other means and to form all ten means as linear functions of three terms in geometrical progression (v. vol. i. pp. 124-129).

angle B right, and let $A\Delta$ be drawn, and let ΔE be placed equal to AB, then if EA be bisected at Z, and $Z\Gamma$ be joined, to show that the sum of the two sides ΔZ , $Z\Gamma$ within the triangle, is greater than the sum of the two sides BA, $\Delta\Gamma$ without the triangle.

And it is obvious. For

since
$$\Gamma Z + ZA > \Gamma A$$
, [Eucl. i. 20 i.e., $\Gamma Z + ZE > \Gamma A$, while $\Delta E = AB$, \therefore [$\Gamma Z + ZE + E\Delta = \Gamma A + A$ i.e.,] $\Gamma Z + Z\Delta > \Gamma A + AB$

But it is clear that this type of proposition, according to the different ways in which one might wish to propound it, can take an infinite number of forms, and it is not out of place to discuss such problems more generally and [first] to propound this from the so-called paradoxes of Erycinus.^a

(e) THE REGULAR SOLIDS b

Ibid. iii, 40, 75, ed. Hultsch 132, 1-11

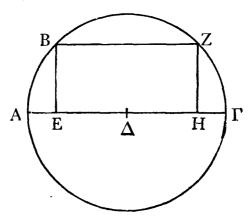

In order to inscribe the five polyhedra in a sphere, these things are premised.

Let $AB\Gamma$ be a circle in a sphere, with diameter $A\Gamma$ and centre Δ , and let it be proposed to insert in the

"Nothing further is known of Erycinus. The propositions next investigated are more elaborate than the one just solved.

^b This is the fourth subject dealt with in *Coll*. iii. For the treatment of the subject by earlier geometers, v. vol. i. pp. 216-225, 466-479.

κύκλον ϵ μβαλεῖν ϵ υθεῖαν παράλληλον μὲν τ $\hat{\eta}$ ΑΓ διαμέτρ ω , ἴσην δὲ τ $\hat{\eta}$ δοθείση μη μείζονι οὕση τ $\hat{\eta}$ s ΑΓ διαμέτρου.

Κείσθω τ $\hat{\eta}$ ήμισεία τ $\hat{\eta}$ ς δοθείσης ἴση ή ΕΔ, καὶ τ $\hat{\eta}$ ΑΓ διαμέτρω ήχθω πρὸς ὀρθὰς ή ΕΒ, τ $\hat{\eta}$ δὲ ΑΓ παράλληλος ή ΒΖ, ήτις ἴση ἔσται τ $\hat{\eta}$ δοθείση· διπλ $\hat{\eta}$ γάρ ἐστιν τ $\hat{\eta}$ ς ΕΔ, ἐπεὶ καὶ ἴση τ $\hat{\eta}$ ΕΗ, παραλλήλου ἀχθείσης τ $\hat{\eta}$ ς ΖΗ τ $\hat{\eta}$ ΒΕ.

(f) Extension of Pythagoras's Theorem Ibid. iv. 1. 1, ed. Hultsch 176. 9-178, 13

' Εὰν $\hat{\eta}$ τρίγωνον τὸ ABΓ, καὶ ἀπὸ τῶν AB, BΓ ἀναγραφ $\hat{\eta}$ τυχόντα παραλληλόγραμμα τὰ ABΔΕ, BΓΖΗ, καὶ αἱ ΔΕ, ZΗ ἐκβληθῶσιν ἐπὶ τὸ Θ, καὶ ἐπιζευχθ $\hat{\eta}$ $\hat{\eta}$ ΘΒ, γίνεται τὰ ABΔΕ, 574

circle a chord parallel to the diameter $A\Gamma$ and equal to a given straight line not greater than the diameter $A\Gamma$.

Let $E\Delta$ be placed equal to half of the given straight line, and let EB be drawn perpendicular to the diameter $A\Gamma$, and let BZ be drawn parallel to $A\Gamma$; then shall this line be equal to the given straight line. For it is double of $E\Delta$, inasmuch as ZH, when drawn, is parallel to BE, and it is therefore equal to EH.

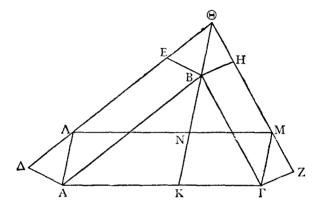

(f) Extension of Pythagoras's Theorem

Ibid. iv. 1. 1, ed. Hultsch 176. 9-178. 13

If ABT be a triangle, and on AB, BT there be described any parallelograms AB Δ E, BTZH, and Δ E. ZH be produced to Θ , and Θ B be joined, then the

^a This lemma gives the key to Pappus's method of inscribing the regular solids, which is to find in the case of each solid certain parallel circular sections of the sphere. In the case of the cube, for example, he finds two equal and parallel circular sections, the square on whose diameter is two-thirds of the square on the diameter of the sphere. The squares inscribed in these circles are then opposite faces of the cube. In each case the method of analysis and synthesis is followed. The treatment is quite different from Euclid's.

ΒΓΖΗ παραλληλόγραμμα ἴσα τῷ ὑπὸ τῶν ΑΓ, ΘΒ περιεχομένῳ παραλληλογράμμῳ ἐν γωνία ἥ ἐστιν ἴση συναμφοτέρῳ τῆ ὑπὸ ΒΑΓ, $\Delta\Theta$ B.

' Εκβεβλήσθω γὰρ ἡ ΘΒ ἐπὶ τὸ Κ, καὶ διὰ τῶν Α, Γ τῆ ΘΚ παράλληλοι ἤχθωσαν αἱ ΑΛ, ΓΜ, καὶ ἐπεζεύχθω ἡ ΛΜ. ἐπεὶ παραλληλόγραμμόν ἐστιν τὸ ΑΛΘΒ, αἱ ΑΛ, ΘΒ ἴσαι τέ εἰσιν καὶ παράλληλοι. ὁμοίως καὶ αἱ ΜΓ, ΘΒ ἴσαι τέ εἰσιν καὶ παράλληλοι, ὥστε καὶ αἱ ΛΑ, ΜΓ ἴσαι τέ εἰσιν καὶ παράλληλοι. καὶ αἱ ΛΜ, ΑΓ ἄρα ἴσαι τε καὶ παράλληλοι. καὶ αἱ ΛΜ, ΑΓ ἄρα ἴσαι τε καὶ παράλληλοι εἰσιν παραλληλόγραμμον ἄρα ἐστὶν τὸ ΑΛΜΓ ἐν γωνία τῆ ὑπὸ ΛΑΓ, τουτ-έστιν συναμφοτέρω τῆ τε ὑπὸ ΒΑΓ καὶ ὑπὸ ΔΘΒ ἴση γάρ ἐστιν ἡ ὑπὸ ΔΘΒ τῆ ὑπὸ ΛΑΒ. καὶ ἐπεὶ τὸ ΔΑΒΕ παραλληλόγραμμον τῷ ΛΑΒΘ ἴσον ἐστίν (ἐπί τε γὰρ τῆς αὐτῆς βάσεως ἐστιν 576

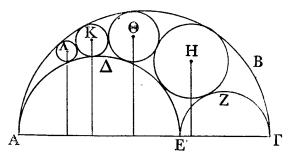

parallelograms AB Δ E, BlZH are together equal to the parallelogram contained by AF, Θ B in an angle which is equal to the sum of the angles BAF, $\Delta\Theta$ B,

For let ΘB be produced to K, and through A, Γ let AA, Γ M be drawn parallel to Θ K, and let Λ M be joined. Since $AA\ThetaB$ is a parallelogram, AA, \ThetaB are equal and parallel. Similarly M Γ , Θ B are equal and parallel, so that $\Lambda\Lambda$, M Γ are equal and parallel. And therefore ΛM , $\Lambda \Gamma$ are equal and parallel; therefore $AAM\Gamma$ is a parallelogram in the angle $AA\Gamma$, that is an angle equal to the sum of the angles BAI and $\Delta \Theta B$; for the angle $\Delta \Theta B$ = angle ΛAB . And since the parallelogram ΔABE is equal to the parallelogram $\Lambda AB\Theta$ (for they are upon the same base AB and in the VOL. II 2 P 577

τῆς ΑΒ καὶ ἐν ταῖς αὐταῖς παραλλήλοις ταῖς ΑΒ, ΔΘ), ἀλλὰ τὸ ΛΑΒΘ τῷ ΛΑΚΝ ἴσον ἐστίν (ἐπί τε γὰρ τῆς αὐτῆς βάσεώς ἐστιν τῆς ΛΑ καὶ ἐν ταῖς αὐταῖς παραλλήλοις ταῖς ΛΑ, ΘΚ), καὶ τὸ ΑΔΕΒ ἄρα τῷ ΛΑΚΝ ἴσον ἐστίν. διὰ τὰ αὐτὰ καὶ τὸ ΒΗΖΓ τῷ ΝΚΓΜ ἴσον ἐστίν· τὰ ἄρα ΔΑΒΕ, ΒΗΖΓ παραλληλόγραμμα τῷ ΛΑΓΜ ἴσα ἐστίν, τουτέστιν τῷ ὑπὸ ΑΓ, ΘΒ ἐν γωνία τῆ ὑπὸ ΛΑΓ, ἥ ἐστιν ἴση συναμφοτέραις ταῖς ὑπὸ ΒΑΓ, ΒΘΔ. καὶ ἔστι τοῦτο καθολικώτερον πολλῷ τοῦ ἐν τοῖς ὀρθογωνίοις ἐπὶ τῶν τετραγώνων ἐν τοῖς Στοιχείοις δεδειγμένου.

(g) Circles Inscribed in the $a\rho\beta\eta\lambda$ os Ibid. iv. 14. 19, ed. Hultsch 208. 9-21

Φέρεται ἔν τισιν ἀρχαία πρότασις τοιαύτη· ὑποκείσθω τρία ἡμικύκλια ἐφαπτόμενα ἀλλήλων

τὰ ΑΒΓ, ΑΔΕ, ΕΖΓ, καὶ εἰς τὸ μεταξὺ τῶν περιφερειῶν αὐτῶν χωρίον, ὃ δὴ καλοῦσιν ἄρβηλον, 578

same parallels AB, $\Delta\Theta$), while $\Lambda AB\Theta = \Lambda AKN$ (for they are upon the same base ΛA and in the same parallels ΛA , ΘK), therefore $A\Delta EB = \Lambda AKN$. By the same reasoning BHZI' = NKTM; therefore the parallelograms ΔABE , BHZI' are together equal to $\Lambda A\Gamma M$, that is, to the parallelogram contained by $A\Gamma$, ΘB in the angle $\Lambda A\Gamma$, which is equal to the sum of the angles $BA\Gamma$, $B\Theta\Delta$. And this is much more general than the theorem proved in the *Elements* about the squares on right-angled triangles.

(g) Circles Inscribed in the $\mu\rho\beta\eta\lambda$ os (g) Hid, iv. 14. 19, ed. Hultsch 208. 9-21

There is found in certain [books] an antient proposition to this effect: Let ABI, ADE, EZI be supposed to be three semicircles touching each other, and in the space between their circumferences, which

^a Eucl. i. 47, v. vol. i. pp. 178-185. In the case taken by Pappus, the first two parallelograms are drawn outwards and the third, equal to their sum, is drawn inwards. If the areas of parallelograms drawn outwards be regarded as of opposite sign to the areas of those drawn inwards, the theorem may be still further generalized, for the algebraic sum of the three parallelograms is equal to zero.

έγγεγράφθωσαν κύκλοι ἐφαπτόμενοι τῶν τε ἡμικυκλίων καὶ ἀλλήλων ὁσοιδηποτοῦν, ὡς οἱ περὶ κέντρα τὰ H, Θ , K, Λ · δεῖξαι τὴν μὲν ἀπὸ τοῦ H κέντρου κάθετον ἐπὶ τὴν $A\Gamma$ ἴσην τῇ διαμέτρω τοῦ περὶ τὸ H κύκλου, τὴν δ' ἀπὸ τοῦ Θ κάθετον διπλασίαν τῆς διαμέτρου τοῦ περὶ τὸ Θ κύκλου, τὴν δ' ἀπὸ τοῦ K κάθετον τριπλασίαν, καὶ τὰς έξῆς καθέτους τῶν οἰκείων διαμέτρων πολλαπλασίας κατὰ τοὺς έξῆς μονάδι ἀλλήλων ὑπερέχοντας ἀριθμοὺς ἐπ' ἄπειρον γινομένης τῆς τῶν κύκλων ἐγγραφῆς.

^a Three propositions (Nos. 4, 5 and 6) about the figure known as the $\tilde{a}\rho\beta\eta\lambda$ os from its resemblance to a leatherworker's knife are contained in Archimedes' Liber Assumptorum, which has survived in Arabic. They are included as particular cases in Pappus's exposition, which is unfortunately too long for reproduction here. Professor D'Arcy W. Thompson (The Classical Review, lvi. (1942), pp. 75-76) gives reasons for thinking that the $\tilde{a}\rho\beta\eta\lambda$ os was a saddler's knife rather than a shoemaker's knife, as usually translated.

is called the "leather-worker's knife," let there be inscribed any number whatever of circles touching both the semicircles and one another, as those about the centres H, θ , K, Λ ; to prove that the perpendicular from the centre H to $\Lambda\Gamma$ is equal to the diameter of the circle about H, the perpendicular from θ is double of the diameter of the circle about θ , the perpendicular from K is triple, and the [remaining] perpendiculars in order are so many times the diameters of the proper circles according to the numbers in a series increasing by unity, the inscription of the circles proceeding without limit.^a

(h) Spiral on a Sphere b

Ibid. iv. 35. 53-56, ed. Hultsch 264. 3-268. 21

Just as in a plane a spiral is conceived to be generated by the motion of a point along a straight line revolving in a circle, and in solids [, such as the cylinder or cone,]^c by the motion of a point along one straight line describing a certain surface, so also a corresponding spiral can be conceived as described on the sphere after this manner.

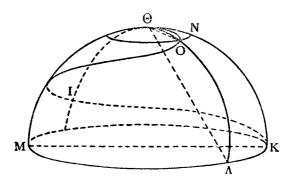

Let KAM be a great circle in a sphere with pole θ , and from θ let the quadrant of a great circle θ NK be

b After leaving the $\check{\alpha}\rho\beta\eta\lambda\sigma$ s, Pappus devotes the remainder of Book iv. to solutions of the problems of doubling the cube, squaring the circle and trisecting an angle. This part has been frequently cited already (v. vol. i. pp. 298-309, 336-363). His treatment of the spiral is noteworthy because his method of proof is often markedly different from that of Archimedes; and in the course of it he makes this interesting digression.

^c Some such addition is necessary, as Commandinus.

Chasles and Hultsch realized.

κύκλου τεταρτημόριον γεγράφθω τὸ ΘΝΚ, καὶ ή μὲν ΘΝΚ περιφέρεια, περὶ τὸ Θ μένον φερομένη κατὰ τῆς ἐπιφανείας ὡς ἐπὶ τὰ Λ, Μ μέρη,

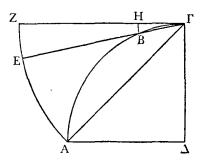

ἀποκαθιστάσθω πάλιν ἐπὶ τὸ αὐτό, σημεῖον δέ τι φερόμενον ἐπ' αὐτῆς ἀπὸ τοῦ Θ ἐπὶ τὸ Κ παραγινέσθω· γράφει δή τινα ἐπὶ τῆς ἐπιφανείας ἔλικα, οἴα ἐστὶν ἡ ΘΟΙΚ, καὶ ἤτις αν ἀπὸ τοῦ Θ γραφῆ μεγίστου κύκλου περιφέρεια, πρὸς τὴν ΚΛ περιφέρειαν λόγον ἔχει ὃν ἡ $\Lambda\Theta$ πρὸς τὴν $\ThetaO\cdot$ λέγω δὴ ὅτι, αν ἐκτεθῆ τεταρτημόριον τοῦ μεγίστου ἐν τῆ σφαίρα κύκλου τὸ $AB\Gamma$ περὶ κέντρον τὸ Δ , καὶ επιζευχθή ή ΓΑ, γίνεται ώς ή τοῦ ήμισφαιρίου επιφάνεια πρὸς τὴν μεταξὺ τῆς ΘΟΙΚ ἔλικος καὶ τῆς ΚΝΘ περιφερείας ἀπολαμβανομένην ἐπιφάνειαν. οὕτως ὁ ΑΒΓΔ τομεὺς πρὸς τὸ ΑΒΓ τμῆμα. 582

described, and, Θ remaining stationary, let the arc Θ NK revolve about the surface in the direction Λ , M

and again return to the same place, and [in the same time] let a point on it move from θ to K; then it will describe on the surface a certain spiral, such as θOIK , and if any arc of a great circle be drawn from θ [cutting the circle $K\Lambda M$ first in Λ and the spiral first in O]. its circumference a will bear to the arc $K\Lambda$ the same ratio as $\Lambda\theta$ bears to θO . I say then that if a quadrant ABT of a great circle in the sphere be set out about centre Δ , and ΓA be joined, the surface of the hemisphere will bear to the portion of the surface intercepted between the spiral θOIK and the arc $KN\theta$ the same ratio as the sector $AB\Gamma\Delta$ bears to the segment $AB\Gamma$.

For let ΓZ be drawn to touch the circumference, and with centre Γ let there be described through A the arc AEZ; then the sector AB $\Gamma \Delta$ is equal to the

 $^{^{}a}$ Or, of course, the circumference of the circle KAM to which it is equal.

ΑΕΖΓ (διπλασία μὲν γὰρ ἡ πρὸς τῷ Δ γωνία τῆς ὑπὸ ΑΓΖ, ἥμισυ δὲ τὸ ἀπὸ ΔΑ τοῦ ἀπὸ ΑΓ)· ὅτι ἄρα καὶ ὡς αἱ εἰρημέναι ἐπιφάνειαι πρὸς ἀλλήλας, οὕτως ὁ ΑΕΖΓ τομεὺς πρὸς τὸ ΑΒΓ

 $\tau \mu \hat{\eta} \mu a$.

"Έστω, δ μέρος ή ΚΛ περιφέρεια τῆς ὅλης τοῦ κύκλου περιφερείας, καὶ τὸ αὐτὸ μέρος περιφέρεια ἡ ΖΕ τῆς ΖΑ, καὶ ἐπεζεύχθω ἡ ΕΓ· ἔσται δὴ καὶ ἡ ΒΓ τῆς ΑΒΓ τὸ αὐτὸ μέρος. δ δὲ μέρος ἡ ΚΛ τῆς ὅλης περιφερείας, τὸ αὐτὸ καὶ ἡ ΘΟ τῆς ΘΟΛ. καὶ ἔστιν ἴση ἡ ΘΟΛ τῆ ΑΒΓ· ἴση ἄρα καὶ ἡ ΘΟ τῆ ΒΓ. γεγράφθω περὶ πόλον τὸν Θ διὰ τοῦ Ο περιφέρεια ἡ ΟΝ, καὶ διὰ τοῦ Β περὶ τὸ Γ κέντρον ἡ ΒΗ. ἐπεὶ οὖν ὡς ἡ ΛΚΘ σφαιρικὴ ἐπιφάνεια πρὸς τὴν ΟΘΝ, ἡ ὅλη τοῦ ἡμισφαιρίου ἐπιφάνεια πρὸς τὴν τοῦ τμήματος ἐπιφάνειαν οὖ ἡ ἐκ τοῦ πόλου ἐστὶν ἡ ΘΟ, ὡς δ' ἡ τοῦ ἡμισφαιρίου ἐπιφάνεια πρὸς τὴν τοῦ τμήματος ἐπιφάνειαν, οὕτως ἐστὶν τὸ ἀπὸ τῆς τὰ Θ, Λ ἐπιζευγνυούσης εὐθείας τετράγωνον πρὸς τὸ ἀπὸ τῆς ἐπὶ τὰ Θ, Ο, ἢ τὸ ἀπὸ τῆς ΕΓ τετράγωνον πρὸς τὸ ἀπὸ τῆς ἐπὶ τὰ Θ, ΕΖΓ τομεὺς πρὸς τὸν ΒΗΓ. ὁμοίως δείξομεν ὅτι καὶ ὡς πάντες οἱ ἐν τῷ ἡμισφαιρίω τομεῖς οἱ ἴσοι τῷ ΚΛΘ, οἵ

^a Pappus's method of proof is, in the Archimedean manner, to circumscribe about the surface to be measured a figure consisting of sectors on the sphere, and to circumscribe about the segment ABT a figure consisting of sectors of circles; in the same way figures can be inscribed. The divisions need, therefore, to be as numerous as possible. The conclusion can then be reached by the method of exhaustion.

sector AEZ Γ (for angle A $\Delta\Gamma$ =2 angle A Γ Z, and Δ A²= $\frac{1}{2}$ A Γ ²); I say, then, that the ratio of the aforesaid surfaces one towards the other is the same as the ratio of the sector AEZ Γ to the segment AB Γ .

Let ZE be the same [small] a part of ZA as KA is of the whole circumference of the circle, and let ΕΓ be joined: then the arc B Γ will be the same part of the arc AB Γ . But Θ O is the same part of Θ O Λ as KA is of the whole circumference by the property of the spiral. And are $\Theta O \Lambda = \text{are AB} \Gamma$ [ex constructione. Therefore $\Theta O = B \Gamma$. Let there be described through () about the pole Θ the arc ON, and through B about centre I' the arc BH. Then since the [sector of the spherical surface $\Lambda K\Theta$ bears to the sector OON the same ratio as the whole surface of the hemisphere bears to the surface of the segment with pole of and circular base ON, while the surface of the hemisphere bears to the surface of the segment the same ratio as $\Theta \Lambda^2$ to ΘO^2 , d or $E \Gamma^2$ to $B \Gamma^2$, therefore the sector $K\Lambda\Theta$ on the surface [of the sphere] bears to OON the same ratio as the sector $EZ\Gamma$ in the planel bears to the sector BHT. Similarly we may show that all the sectors [on the surface of] the hemi-

^c Because the arc ΛK is the same part of the circumference

KAM as the arc ON is of its circumference.

^b For arc ZA: arc ZE=angle ZΓA: angle ZΓE. But angle ZΓA= $\frac{1}{2}$. angle AΔΓ, and angle ZΓE= $\frac{1}{2}$. angle BΔΓ [Eucl. iii. 32, 20]. ∴ arc ZA: arc ZE=arc ABΓ: arc BΓ.

^d The square on ΘΛ is double the square on the radius of the hemisphere, and therefore half the surface of the hemisphere is equal to a circle of radius ΘΛ [Archim. De sph. et cyl. i. 33]: and the surface of the segment is equal to a circle of radius ΘΟ [ibid. i. 42]; and as circles are to one another as the squares on their radii [Eucl. xii. 2], the surface of the hemisphere bears to the surface of the segment the ratio ΘΛ²: ΘΟ².

είσιν ή όλη τοῦ ήμισφαιρίου ἐπιφάνεια, πρὸς τοὺς περιγραφομένους περὶ τὴν ἔλικα τομέας όμοταγεῖς τῷ ΟΘΝ, οὕτως πάντες οἱ ἐν τῷ ΑΖΓ τομεῖς οἱ ισοι τῶ ΕΖΓ, τουτέστιν όλος ὁ ΑΖΓ τομεύς, πρὸς τούς περιγραφομένους περί το ΑΒΓ τμημα τούς δμοτανείς τω ΓΒΗ. τω δ' αὐτω τρόπω δειχθήσεται καὶ ώς ή τοῦ ἡμισφαιρίου ἐπιφάνεια πρὸς τοὺς ἐγγραφομένους τῆ ἔλικι τομέας, οὕτως ὁ ΑΖΓ τομεὺς πρὸς τοὺς ἐγγραφομένους τῷ ΑΒΓ τμήματι τομέας, ώστε καὶ ώς ή τοῦ ήμισφαιρίου έπιφάνεια πρὸς τὴν ὑπὸ τῆς εκλικος ἀπολαμβανομένην επιφάνειαν, ουτως ὁ ΑΖΓ τομεύς, τουτέστιν τὸ ΑΒΓΔ τεταρτημόριον, πρὸς τὸ ΑΒΓ τμῆμα. συνάγεται δὲ διὰ τούτου ἡ μὲν ἀπὸ τῆς ἔλικος άπολαμβανομένη ἐπιφάνεια πρὸς τὴν ΘΝΚ περιφέρειαν ὀκταπλασία τοῦ ΑΒΓ τμήματος (ἐπεὶ καὶ ἡ τοῦ ἡμισφαιρίου ἐπιφάνεια τοῦ ΑΒΓΔ τομέως), ή δε μεταξύ της ελικος και της βάσεως τοῦ ἡμισφαιρίου ἐπιφάνεια ὀκταπλασία τοῦ ΑΓΔ τριγώνου, τουτέστιν ίση τῷ ἀπὸ τῆς διαμέτρου της σφαίρας τετραγώνω.

^b For the surface of the hemisphere is double of the circle of radius AΔ [Archim. De sph. et cyl. i. 33] and the sector

 $\Lambda B\Gamma \Delta$ is one-quarter of the circle of radius $A\Delta$.

8 segment AB Γ , =8 sector AB Γ Δ - 8 segment AB Γ

^a This would be proved by the method of exhaustion. It is proof of the great part played by this method in Greek geometry that Pappus can take its validity for granted.

^c For the surface between the spiral and the base of the hemisphere is equal to the surface of the hemisphere less the surface cut off from the spiral in the direction ΘNK,

i.e. Surface in question = surface of hemisphere -

sphere equal to $KA\Theta$, together making up the whole surface of the hemisphere, bear to the sectors described about the spiral similar to OON the same ratio as the sectors in AZI' equal to EZI', that is the whole sector AZΓ, bear to the sectors described about the segment ABI similar to IBH. In the same manner it may be shown that the surface of the hemisphere bears to the [sum of the] sectors inscribed in the spiral the same ratio as the sector AZI' bears to the [sum of the] sectors inscribed in the segment ABI, so that the surface of the hemisphere bears to the surface cut off by the spiral the same ratio as the sector AZΓ, that is the quadrant ABΓΔ, bears to the segment ABI'.a From this it may be deduced that the surface cut off from the spiral in the direction of the arc ΘNK is eight times the segment $AB\Gamma$ (since the surface of the hemisphere is eight times the sector AB $\Gamma\Delta$), b while the surface between the spiral and the base of the hemisphere is eight times the triangle AI'A, that is, it is equal to the square on the diameter of the sphere.

> =8 triangle $A\Gamma\Delta$ = $4A\Delta^2$ = $(2A\Delta)^2$,

and $2A\Delta$ is the diameter of the sphere.

Heath (H.G.M. ii. 384-385) gives for this elegant proposition an analytical equivalent, which I have adapted to the Greek lettering. If ρ , ω are the spherical co-ordinates of O with reference to Θ as pole and the arc Θ NK as polar axis, the equation of the spiral is $\omega = 4\rho$. If A is the area of the spiral to be measured, and the radius of the sphere is taken as unity, we have as the element of area

$$dA = d\omega(1 - \cos \rho) = 4d\rho(1 - \cos \rho).$$

$$= \frac{1}{4} \frac{1}$$

^e The whole of Book v. in Pappus's Collection is devoted to isoperimetry. The first section follows closely the exposition of Zenodorus as given by Theon (v. supra, pp. 386-395), 588

(i) Isoperimetric Figures a

Ibid. v., Preface 1-3, ed. Hultsch 304, 5-308, 5

Though God has given to men, most excellent Megethion, the best and most perfect understanding of wisdom and mathematics, He has allotted a partial share to some of the unreasoning creatures as well. To men, as being endowed with reason, He granted that they should do everything in the light of reason and demonstration, but to the other unreasoning creatures He gave only this gift, that each of them should, in accordance with a certain natural forethought, obtain so much as is needful for supporting life. This instinct may be observed to exist in many other species of creatures, but it is specially marked among bees. Their good order and their obedience to the queens who rule in their commonwealths are truly admirable, but much more admirable still is their emulation, their cleanliness in the gathering of honey, and the forethought and domestic care they give to its protection. Believing themselves, no doubt, to be entrusted with the task of bringing from the gods to the more cultured part of mankind a share of

except that Pappus includes the proposition that of all circular segments having the same circumference the semicircle is the greatest. The second section compares the volumes of solids whose surfaces are equal, and is followed by a digression, already quoted (supra, pp. 194-197) on the semi-regular solids discovered by Archimedes. After some propositions on the lines of Archimedes' De sph. et cyl., Pappus finally proves that of regular solids having equal surfaces, that is greatest which has most faces.

The introduction, here cited, on the sagacity of bees is rightly praised by Heath (H.G.M. ii. 389) as an example of the good style of the Greek mathematicians when freed from

the restraints of technical language.

τής ἀμβροσίας ἀπόμοιράν τινα ταύτην οὐ μάτην ἐκχεῖν εἰς γῆν καὶ ξύλον ἤ τινα ἐτέραν ἀσχήμονα καὶ ἄτακτον ὕλην ἠξίωσαν, ἀλλ' ἐκ τῶν ἡδίστων ἐπὶ γῆς φυομένων ἀνθέων συνάγουσαι τὰ κάλλιστα κατασκευάζουσιν ἐκ τούτων εἰς τὴν τοῦ μέλιτος ὑποδοχὴν ἀγγεῖα τὰ καλούμενα κηρία πάντα μὲν άλλήλοις ισα καὶ ὅμοια καὶ παρακείμενα, τῶ δὲ

τχήματι έξάγωνα. ambrosia in this form, they do not think it proper to pour it carelessly into earth or wood or any other unseemly and irregular material, but, collecting the fairest parts of the sweetest flowers growing on the earth, from them they prepare for the reception of the honey the vessels called honeycombs, [with cells] all equal, similar and adjacent, and hexagonal in form.

That they have contrived this in accordance with a certain geometrical forethought we may thus infer. They would necessarily think that the figures must all be adjacent one to another and have their sides common, in order that nothing else might fall into the interstices and so defile their work. Now there are only three rectilineal figures which would satisfy the condition, I mean regular figures which are equilateral and equiangular, inasmuch as irregular figures would be displeasing to the bees. For equilateral triangles and squares and hexagons can lie adjacent to one another and have their sides in common without irregular interstices. For the space about the same point can be filled by six equilateral triangles and six angles, of which each is $\frac{2}{3}$ right angle, or by four squares and four right angles, or by three hexagons and three angles of a hexagon, of which each is 11 right angle. But three pentagons would not suffice to fill the space about the same point, and four would be more than sufficient; for three angles of the pentagon are less than four right angles (inasmuch

 *Εστω κύκλος ὁ $AB\Gamma$, οὖ κέντρον τὸ E, καὶ ἀπὸ τοῦ E πρὸς ὀρθὰς ἔστω τῷ τοῦ κύκλου ἐπι-592

as each angle is 1½ right angle), and four angles are greater than four right angles. Nor can three heptagons be placed about the same point so as to have their sides adjacent to each other; for three angles of a heptagon are greater than four right angles (inasmuch as each is 1½ right angle). And the same argument can be applied even more to polygons with a greater number of angles. There being, then, three figures capable by themselves of filling up the space around the same point, the triangle, the square and the hexagon, the bees in their wisdom chose for their work that which has the most angles, perceiving that it would hold more honey than either of the two others.

Bees, then, know just this fact which is useful to them, that the hexagon is greater than the square and the triangle and will hold more honey for the same expenditure of material in constructing each. But we, claiming a greater share in wisdom than the bees, will investigate a somewhat wider problem, namely that, of all equilateral and equiangular plane figures having an equal perimeter, that which has the greater number of angles is always greater, and the greatest of them all is the circle having its perimeter equal to them.

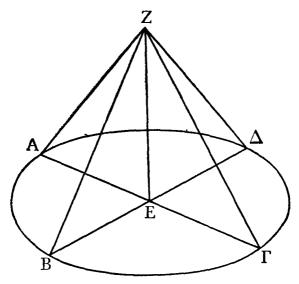

(j) Apparent Form of a Circle *Ibid.* vi.^a 48. 90-91, ed. Hultsch 580. 12-27

Let ABT be a circle with centre E, and from E let EZ be drawn perpendicular to the plane of the circle;

vol. 11 2 Q 593

^a Most of Book vi. is astronomical, covering the treatises in the *Little Astronomy* (r. supra, p. 408 n. b). The proposition here cited comes from a section on Euclid's Optics.

πέδω ή ΕΖ· λέγω, ὅτι ἐὰν ἐπὶ τῆς ΕΖ τὸ ὅμμα τεθῆ ἴσαι αἱ διάμετροι φαίνονται τοῦ κύκλου.

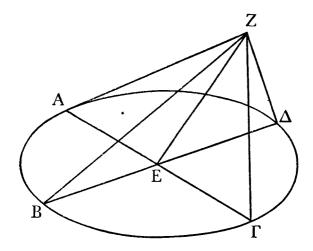

Τοῦτο δὲ δηλον ἄπασαι γὰρ αι ἀπὸ τοῦ Ζ πρὸς τὴν τοῦ κύκλου περιφέρειαν προσπίπτουσαι εὐθεῖαι ἴσαι εἰσὶν ἀλλήλαις καὶ ἴσας γωνίας περιέχουσιν.

Μὴ ἔστω δὲ ἡ ΕΖ πρὸς ὀρθὰς τῷ τοῦ κύκλου ἐπιπέδῳ, ἴση δὲ ἔστω τῆ ἐκ τοῦ κέντρου τοῦ κύκλου λέγω, ὅτι τοῦ ὅμματος ὅντος πρὸς τῷ Ζ σημείῳ καὶ οὕτως αὶ διάμετροι ἴσαι ὁρῶνται.

lines EA, E Γ , EZ are equal, therefore the angle AZ Γ is right. And by the same reasoning the angle BZ Δ is right; therefore the diameters A Γ , B Δ appear equal. Similarly we may show that all are equal.

(k) The "Treasury of Analysis"

Ibid. vii., Preface 1-3, ed. Hultsch 634, 3-636, 30

The so-called *Treasury of Analysis*, my dear Hermodorus, is, in short, a special body of doctrine furnished for the use of those who, after going through the usual elements, wish to obtain power to solve problems set to them involving curves, and for this purpose only is it useful. It is the work of three men, Euclid the writer of the *Elements*, Apollonius of Perga and Aristaeus the elder, and proceeds by the method of analysis and synthesis.

Now analysis is a method of taking that which is sought as though it were admitted and passing from it through its consequences in order to something which is admitted as a result of synthesis; for in analysis we suppose that which is sought to be already done, and we inquire what it is from which this comes about, and again what is the antecedent cause of the latter, and so on until, by retracing our steps, we light upon something already known or ranking as a first principle; and such a method we call analysis, as being a reverse solution.

But in *synthesis*, proceeding in the opposite way, we suppose to be already done that which was last reached in the analysis, and arranging in their natural

^a Or, perhaps, "to give a complete theoretical solution of problems set to them"; v. supra, p. 414 n. a.

ηγούμενα κατὰ φύσιν τάξαντες καὶ ἀλλήλοις ἐπισυνθέντες, εἰς τέλος ἀφικνούμεθα τῆς τοῦ ζητουμένου κατασκευῆς καὶ τοῦτο καλοῦμεν σύνθεσιν.

Διττὸν δ' ἐστὶν ἀναλύσεως γένος τὸ μὲν ζητητικὸν τάληθοῦς, δ καλεῖται θεωρητικόν, τὸ δὲ ποριστικόν τοῦ προταθέντος [λέγειν], δ καλεῖται προβληματικόν. ἐπὶ μὲν οὖν τοῦ θεωρητικοῦ γένους τὸ ζητούμενον ὡς ὂν ὑποθέμενοι καὶ ὡς ἀληθές, εἶτα διὰ τῶν ἑξῆς ἀκολούθων ὡς ἀληθῶν καὶ ώς ἔστιν καθ' ὑπόθεσιν προελθόντες ἐπί τι δμολογούμενον, έὰν μὲν ἀληθὲς ἢ ἐκεῖνο τὸ ομολογούμενον, ἀληθὲς ἔσται καὶ το ζητούμενον, καὶ ἡ ἀπόδειξις ἀντίστροφος τῆ ἀναλύσει, ἐὰν δὲ ψεύδει όμολογουμένω έντύχομεν, ψεῦδος ἔσται καὶ τὸ ζητούμενον. ἐπὶ δὲ τοῦ προβληματικοῦ γένους τὸ προταθὲν ώς γνωσθὲν ὑποθέμενοι, εἶτα διὰ τῶν έξης ἀκολούθων ώς ἀληθῶν προελθόντες ἐπί τι όμολογούμενον, έὰν μὲν τὸ όμολογούμενον δυνατον ή και ποριστόν, δ καλουσιν οι άπο των μαθημάτων δοθέν, δυνατον έσται καὶ τὸ προταθέν, καὶ πάλιν ή ἀπόδειξις ἀντίστροφος τῆ ἀναλύσει, εαν δε αδυνάτω ομολογουμένω εντύχομεν, αδύνατον έσται καὶ τὸ πρόβλημα.

Τοσαθτα μεν οὖν περὶ ἀναλύσεως καὶ συνθέσεως. Τῶν δὲ προειρημένων τοθ ἀναλυομένου βιβλίων ἡ τάξις ἐστὶν τοιαύτη. Εὐκλείδου Δεδομένων βιβλίον ᾱ, ᾿Απολλωνίου Λόγου ἀποτομῆς β̄, Χωρίου ἀποτομῆς β̄, Διωρισμένης τομῆς δύο, Ἐπαφῶν δύο, Εὐκλείδου Πορισμάτων τρία, ᾿Απολλωνίου Νεύσεων δύο, τοθ αὐτοθ Τόπων ἐπιπέδων δύο,

¹ λέγειν om. Hultsch.

order as consequents what were formerly antecedents and linking them one with another, we finally arrive at the construction of what was sought; and this we call synthesis.

Now analysis is of two kinds, one, whose object is to seek the truth, being called theoretical, and the other, whose object is to find something set for finding, being called problematical. In the theoretical kind we suppose the subject of the inquiry to exist and to be true, and then we pass through its consequences in order, as though they also were true and established by our hypothesis, to something which is admitted; then, if that which is admitted be true, that which is sought will also be true, and the proof will be the reverse of the analysis, but if we come upon something admitted to be false, that which is sought will also be false. In the problematical kind we suppose that which is set as already known, and then we pass through its consequences in order, as though they were true, up to something admitted: then, if what is admitted be possible and can be done, that is, if it be what the mathematicians call given, what was originally set will also be possible, and the proof will again be the reverse of the analysis, but if we come upon something admitted to be impossible, the problem will also be impossible.

So much for analysis and synthesis.

This is the order of the books in the aforesaid Treasury of Analysis. Euclid's Data, one book, Apollonius's Cutting-off of a Ratio, two books, Cutting-off of an Area, two books, Determinate Section, two books, Contacts, two books, Euclid's Porisms, three books, Apollonius's Vergings, two books, his Plane Loci, two books, Conics, eight books, Aristaeus's

Κωνικών $\bar{\eta}$, 'Αρισταίου Τόπων στερεών πέντε, Εὐκλείδου Τόπων τῶν πρὸς ἐπιφανεία δύο, 'Ερατοσθένους Περὶ μεσοτήτων δύο. γίνεται βιβλία $\bar{\lambda}\gamma$, ὧν τὰς περιοχὰς μέχρι τῶν 'Απολλωνίου Κωνικῶν ἐξεθέμην σοι πρὸς ἐπίσκεψιν, καὶ τὸ πλῆθος τῶν τόπων καὶ τῶν διορισμῶν καὶ τῶν πτώσεων καθ' ἔκαστον βιβλίον, ἀλλὰ καὶ τὰ λήμματα τὰ ζητούμενα, καὶ οὐδεμίαν ἐν τῆ πραγματεία τῶν βιβλίων καταλέλοιπα ζήτησιν, ὡς ἐνόμιζον.

(l) Locus with Respect to Five or Six Lines (l) Locus with Respect to Five or Six Lines (l) Locus with Respect to Five or Six Lines

Έὰν ἀπό τινος σημείου ἐπὶ θέσει δεδομένας εὐθείας πέντε καταχθώσιν εὐθείαι ἐν δεδομέναις γωνίαις, καὶ λόγος ἢ δεδομένος τοῦ ὑπὸ τριῶν κατηγμένων περιεχομένου στερεοῦ παραλληλεπιπέδου ὀρθογωνίου πρὸς τὸ ὑπὸ τῶν λοιπῶν δύο κατηγμένων καὶ δοθείσης τινὸς περιεχόμενον παραλληλεπίπεδον ὀρθογώνιον, ἄψεται τὸ σημεῖον θέσει δεδομένης γραμμῆς. ἐάν τε ἐπὶ Ϝ, καὶ λόγος ἢ δοθεὶς τοῦ ὑπὸ τῶν τριῶν περιεχομένου προειρημένου στερεοῦ πρὸς τὸ ὑπὸ τῶν λοιπῶν τριῶν, πάλιν τὸ σημεῖον ἄψεται θέσει δεδομένης. ἐὰν δὲ ἐπὶ πλείονας τῶν Ϝ, οὐκέτι μὲν ἔχουσι λέγειν, " ἐὰν λόγος ἢ δοθεὶς τοῦ ὑπὸ τῶν δ περιεχομένου τινὸς πρὸς τὸ ὑπὸ τῶν λοιπῶν," ἐπεὶ οὐκ ἔστι τι

^a These propositions follow a passage on the locus with respect to three or four lines which has already been quoted (v. vol. i. pp. 486-489). The passages come from Pappus's 600

Solid Loci, five books, Euclid's Surface Loci, two books, Eratosthenes' On Means, two books. In all there are thirty-three books, whose contents as far as Apollonius's Conics I have set out for your examination, including not only the number of the propositions, the conditions of possibility and the cases dealt with in each book, but also the lemmas which are required; indeed, I believe that I have not omitted any inquiry arising in the study of these books.

(l) Locus with Respect to Five or Six Lines ^a Ibid. vii. 38-40. ed. Hultsch 680. 2-30

If from any point straight lines be drawn to meet at given angles five straight lines given in position, and the ratio be given between the volume of the rectangular parallelepiped contained by three of them to the volume of the rectangular parallelepiped contained by the remaining two and a given straight line, the point will lie on a curve given in position. If there be six straight lines, and the ratio be given between the volume of the aforesaid solid formed by three of them to the volume of the solid formed by the remaining three, the point will again lie on a curve given in position. If there be more than six straight lines, it is no longer permissible to say "if the ratio be given between some figure contained by four of them to some figure contained by the remainder," since no figure can be contained in more

account of the *Conics* of Apollonius, who had worked out the locus with respect to three or four lines. It was by reflection on this passage that Descartes evolved the system of co-ordinates described in his *Géométrie*.

περιεχόμενον ύπο πλειόνων η τριών διαστάσεων. συγκεχωρήκασι δε εαυτοίς οί βραχύ προ ήμων έρμηνεύειν τὰ τοιαῦτα, μηδὲ εν μηδαμῶς διάληπτον σημαίνοντες, τὸ ὑπὸ τῶνδε περιεχόμενον λέγοντες έπὶ τὸ ἀπὸ τῆσδε τετράγωνον ἢ ἐπὶ τὸ ὑπὸ τῶνδε. παρην δέ διά των συνημμένων λόγων ταῦτα καὶ λένειν καὶ δεικνύναι καθόλου καὶ ἐπὶ τῶν προειρημένων προτάσεων καὶ ἐπὶ τούτων τὸν τρόπον τοῦτον εὰν ἀπό τινος σημείου επὶ θέσει δεδομένας εὐθείας καταχθώσιν εὐθεῖαι ἐν δεδομέναις γωνίαις, καὶ δεδομένος ή λόγος ο συνημμένος έξ οδ έχει μία κατηγμένη πρὸς μίαν καὶ έτέρα πρὸς έτέραν, καὶ ἄλλη πρὸς ἄλλην, καὶ ἡ λοιπὴ πρὸς δοθεῖσαν, $\vec{\epsilon}$ \vec{a} \vec{v} \vec{b} $\vec{\sigma}$ \vec{v} $\vec{\zeta}$, $\vec{\epsilon}$ \vec{a} \vec{v} $\vec{\delta}$ $\vec{\epsilon}$ $\vec{\eta}$, $\vec{\kappa}$ \vec{a} \vec{i} $\vec{\eta}$ $\vec{\lambda}$ \vec{o} \vec{i} $\vec{\eta}$ \vec{i} \vec{j} $\vec{$ τὸ σημεῖον ἄψεται θέσει δεδομένης γραμμῆς καὶ όμοίως όσαι αν ώσιν περισσαί η άρτιαι τὸ πληθος. τούτων, ώς έφην, έπομένων τῷ ἐπὶ τέσσαρας τόπφ οὐδὲ εν συντεθείκασιν, ωστε τὴν γραμμὴν είδέναι.

than three dimensions. It is true that some recent writers have agreed among themselves to use such expressions, a but they have no clear meaning when they multiply the rectangle contained by these straight lines with the square on that or the rectangle contained by those. They might, however, have expressed such matters by means of the composition of ratios, and have given a general proof both for the aforesaid propositions and for further propositions after this manner: If from any point straight lines be drawn to meet at given angles straight lines given in position, and there be given the ratio compounded of that which one straight line so drawn bears to another, that which a second bears to a second, that which a third bears to a third, and that which the fourth bears to a given straight line—if there be seven, or, if there be eight, that which the fourth bears to the fourth-the point will lie on a curve given in position; and similarly. however many the straight lines be, and whether odd or even. Though, as I said, these propositions follow the locus on four lines, [geometers] have by no means solved them to the extent that the curve can be recognized.b

As Heron in his formula for the area of a triangle, given

the sides (supra, pp. 476-477).

^b The general proposition can thus be stated: If p_1 , p_2 $p_3 \ldots p_n$ be the lengths of straight lines drawn to meet n given straight lines at given angles (where n is odd), and a be a given straight line, then if

$$\frac{p_1}{p_2}\cdot\frac{p_3}{p_4}\cdot\cdot\cdot\frac{p_n}{a}=\lambda,$$

where λ is a constant, the point will lie on a curve given in position. This will also be true if n is even and

$$\frac{p_1}{p_2}\cdot\frac{p_3}{p_4}\cdot\cdot\cdot\frac{p_{n-1}}{p_n}=\lambda.$$

(m) Anticipation of Guldin's Theorem Ibid. vii. 41-42, ed. Hultsch 680, 30-682, 20

Ταῦθ' οἱ βλέποντες ἥκιστα ἐπαίρονται, καθάπερ οἱ πάλαι καὶ τῶν τὰ κρείττονα γραψάντων ἔκαστοι ἐγὼ δὲ καὶ πρὸς ἀρχαῖς ἔτι τῶν μαθημάτων καὶ τῆς ὑπὸ φύσεως προκειμένης ζητημάτων ὕλης κινουμένους ὁρῶν ἄπαντας, αἰδούμενος ἐγὼ καὶ δείξας γε πολλῷ κρείσσονα καὶ πολλὴν προφερόμενα ἀφέλειαν . . . ἴνα δὲ μὴ κεναῖς χεροὶ τοῦτο φθεγξάμενος ὧδε χωρισθῶ τοῦ λόγου, ταῦτα δώσω ταῖς ἀναγνοῦσιν ὁ μὲν τῶν τελείων ἀμφοιστικῶν λόγος συνῆπται ἔκ τε τῶν ἀμφοισμάτων καὶ τῶν ἐπὶ τοὺς ἄξονας ὁμοίως κατηγμένων εὐθειῶν ἀπὸ τῶν ἐν αὐτοῖς κεντροβαρικῶν σημείων, ὁ δὲ τῶν ἀτελῶν ἔκ τε τῶν ἀμφοισμάτων καὶ τῶν περιφερειῶν, ὄσας ἐποίησεν τὰ ἐν τούτοις κεντροβαρικὰ σημεῖα, ὁ δὲ τούτων τῶν περιφερειῶν λόγος συνῆπται δῆλον ὡς ἔκ τε τῶν κατηγμένων καὶ ὧν περιέχουσιν αἱ τούτων ἄκραι, εἰ καὶ εἶεν πρὸς τοῖς ἄξοσιν ἀμφοιστικῶν, γωνιῶν. περι-

Though the meaning is clear enough, an exact translation

604

^a Paul Guldin (1577-1643), or Guldinus, is generally credited with the discovery of the celebrated theorem here enunciated by Pappus. It may be stated: If any plane figure revolve about an external axis in its plane, the volume of the solid figure so generated is equal to the product of the area of the figure and the distance travelled by the centre of gravity of the figure. There is a corresponding theorem for the area.

^b The whole passage is ascribed to an interpolator by Hultsch, but without justice; and, as Heath observes (*H.G.M.* ii. 403), it is difficult to think of any Greek mathematician after Pappus's time who could have discovered such an advanced proposition.

(m) Anticipation of Guldin's Theorem a lbid, vii. 41-42, ed. Hultsch 680, 30-682, 20 b

The men who study these matters are not of the same quality as the ancients and the best writers. Seeing that all geometers are occupied with the first principles of mathematics and the natural origin of the subject matter of investigation, and being ashamed to pursue such topics myself, I have proved propositions of much greater importance and utility . . . and in order not to make such a statement with empty hands, before leaving the argument I will give these enunciations to my readers. Figures generated by a complete revolution of a plane figure about an axis are in a ratio compounded (a) of the ratio [of the areas] of the figures, and (b) of the ratio of the straight lines similarly drawn to c the axes of rotation from the respective centres of gravity. Figures generated by incomplete revolutions are in a ratio compounded (a) of the ratio [of the areas] of the figures, and (b) of the ratio of the arcs described by the centres of gravity of the respective figures, the ratio of the arcs being itself compounded (1) of the ratio of the straight lines similarly drawn from the respective centres of gravity to the axes of rotation and (2) of the ratio of the angles contained about the axes of revolution by the extremities of these straight lines.d These propositions, which are practi-

is impossible; I have drawn on the translations made by Halley (v. Papp. Coll., ed. Hultsch 683 n. 2) and Heath (H.G.M. ii. 402-403). The obscurity of the language is presumably the only reason why Hultsch brackets the passage, as he says: "exciderunt autem in eodem loco pauciora plurave genuina Pappi verba."

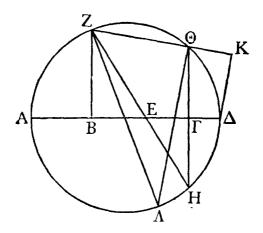

i.e., drawn to meet at the same angles.
 The extremities are the centres of gravity.

έχουσι δὲ αὖται αἱ προτάσεις, σχεδὸν οὖσαι μία, πλεῖστα ὄσα καὶ παντοῖα θεωρήματα γραμμῶν τε καὶ ἐπιφανειῶν καὶ στερεῶν, πάνθ' ἄμα καὶ μιᾳ δείξει καὶ τὰ μήπω δεδειγμένα καὶ τὰ ἤδη ὡς καὶ τὰ ἐν τῷ δωδεκάτῳ τῶνδε τῶν στοιχείων.

(n) LEMMAS TO THE TREATISES

(i.) To the "Determinate Section" of Apollonius Ibid. vii. 115, ed. Hultsch, Prop. 61, 756, 28-760. 4

cally one, include a large number of theorems of all sorts about curves, surfaces and solids, all of which are proved simultaneously by one demonstration, and include propositions never before proved as well as those already proved, such as those in the twelfth book of these elements.^a

- (n) LEMMAS TO THE TREATISES b
- (i.) To the "Determinate Section" of ApolloniusIbid. vii. 115, ed. Hultsch, Prop. 61, 756. 28-760. 4

Given three straight lines AB, B Γ , $\Gamma\Delta$, of AB . B Δ : $A\Gamma$. $\Gamma\Delta$ = BE^2 : $E\Gamma^2$, then the ratio AE . E Δ : BE . E Γ

⁶ If the passage be genuine, which there seems little reason to doubt, this is evidence that Pappus's work ran to twelve books at least.

It is left to be understood that they are in one straight

line $A\Delta$.

b The greater part of Book vii. is devoted to lemmas required for the books in the Treasury of Analysis as far as Apollonius's Conics, with the exception of Euclid's Data and with the addition of two isolated lemmas to Euclid's Surface-Loci. The lemmas are numerous and often highly interesting from the mathematical point of view. The two here cited are given only as samples of this important collection: the first lemma to the Surface-Loci, one of the two passages in Greek referring to the focus-directrix property of a conic, has already been given (vol. i. pp. 492-503).

ΒΕΓ· λέγω δὴ ὅτι ὁ αὐτός ἐστιν τῷ τοῦ ἀπὸ τῆς $A\Delta$ πρὸς τὸ ἀπὸ τῆς ὑπεροχῆς ἡ ὑπερέχει ἡ δυναμένη τὸ ὑπὸ $A\Gamma$, $B\Delta$ τῆς δυναμένης τὸ ὑπὸ AB, $\Gamma\Delta$.

Γεγράφθω περὶ τὴν ΑΔ κύκλος, καὶ ἤχθωσαν όρθαὶ αἱ ΒΖ, ΓΗ. ἐπεὶ οὖν ἐστιν ὡς τὸ ὑπὸ ΑΒΔ πρὸς τὸ ὑπὸ ΑΓΔ, τουτέστιν ὡς τὸ ἀπὸ ΒΖ πρός τὸ ἀπὸ ΓΗ, οὕτως τὸ ἀπὸ ΒΕ πρός τὸ άπὸ ΕΓ, καὶ μήκει ἄρα ἐστὶν ώς ή ΒΖ πρὸς τὴν ΓΗ, ούτως ή ΒΕ πρός την ΕΓ εὐθεῖα ἄρα ἐστὶν ή διὰ τῶν Ζ, Ε, Η. ἔστω ἡ ΖΕΗ, καὶ ἐκβεβλήσθω ἡ μὲν ΗΓ ἐπὶ τὸ Θ, ἐπιζευχθεῖσα δὲ ἡ ΖΘ ἐκ-βεβλήσθω ἐπὶ τὸ Κ, καὶ ἐπ' αὐτὴν κάθετος ἤχθω ή $\Delta \dot{K}$. καὶ διὰ δὴ τὸ προγεγραμμένον λῆμμα γίνεται τὸ μὲν ὑπὸ $A\Gamma$, $B\Delta$ ἴσον τῷ ἀπὸ ZK, τὸ δὲ ὑπὸ \overrightarrow{AB} , $\overrightarrow{\Gamma}\Delta$ τ $\widehat{\omega}$ ἀπὸ $\overrightarrow{\Theta}\overrightarrow{K}$ λοιπὴ ἄρα ἡ $\overrightarrow{Z}\overrightarrow{\Theta}$ ἐστὶν ἡ ὑπεροχὴ ἡ ὑπερέχει ἡ δυναμένη τὸ ὑπὸ ΑΓ, ΒΔ της δυναμένης το ύπο ΑΒ, ΓΔ. ήχθω οὖν διὰ τοῦ κέντρου ἡ ΖΛ, καὶ ἐπεζεύχθω ἡ ΘΛ. ϵ πεὶ οὖν ὀρθὴ ἡ ὑπὸ $Z\Theta\Lambda$ ὀρθ $\hat{\eta}$ τ $\hat{\eta}$ ὑπὸ $E\Gamma H$ $\dot{\epsilon}$ στὶν ἴση, ἔστιν δ $\dot{\epsilon}$ καὶ $\dot{\eta}$ πρὸς τ $\ddot{\tilde{\omega}}$ Λ τ $\hat{\eta}$ πρὸς τ $\hat{\omega}$ Η γωνία ἴση, ἰσογώνια ἄρα τὰ τρίγωνα ἔστιν ἄρα ὡς ἡ ΛΖ΄ πρὸς τὴν ΘΖ, τουτέστιν ὡς ἡ ΑΔ πρὸς τὴν ΖΘ, οὕτως ἡ ΕΗ πρὸς τὴν ΕΓ \cdot καὶ ὡς ἄρα τὸ ἀπὸ ΑΔ πρὸς τὸ ἀπὸ ΖΘ, οὕτως τὸ ἀπὸ ΕΗ πρὸς τὸ ἀπὸ ΕΓ, καὶ τὸ ὑπὸ ΗΕ, ΕΖ, τουτέστιν τὸ ὑπὸ ΑΕ, ΕΔ, πρὸς τὸ ὑπὸ ΒΕ, ΕΓ. καὶ ἔστιν ὁ μὲν τοῦ ὑπὸ ΑΕ, ΕΔ πρὸς τὸ ὑπὸ ΒΕ,

^a For, because BZ: ΓH=BE: ΕΓ, the triangles ZEB, HΕΓ are similar, and angle ZEB=angle HΕΓ; ∴ Γ is in the same straight line with B, E [Eucl. i. 13, Conv.].

is singular and a minimum; and I say that this ratio is equal to $A\Delta^2: (\sqrt{A\Gamma \cdot B\Delta} - \sqrt{AB \cdot \Gamma \Delta})^2$.

Let a circle be described about AA, and let BZ, \GammaH

be drawn perpendicular [to $A\Delta$]. Then since

AB. B
$$\Delta$$
: A Γ . $\Gamma\Delta$ = BE²: E Γ ², [ex hyp. BZ²: Γ H² = BE²: E Γ ², [Eucl. x. 33, Lemma

$$BZ : \Gamma H = BE : E\Gamma.$$

Therefore Z, E, H lie on a straight line.^a Let it be ZEH, and let H Γ be produced to Θ , and let Z Θ be joined and produced to K, and let Δ K be drawn perpendicular to it. Then by the lemma just proved [Lemma 19]

A
$$\Gamma$$
 . B $\Delta = ZK^2$,
AB . $\Gamma\Delta = \Theta K^2$:

i.e.,

[on taking the roots and] subtracting,

$$[ZK - \Theta K =]Z\Theta = \sqrt{A\Gamma \cdot B\Delta} - \sqrt{AB \cdot \Gamma\Delta}.$$

Let $Z\Lambda$ be drawn through the centre, and let $\Theta\Lambda$ be joined. Then since the right angle $Z\Theta\Lambda$ = the right angle EΓH, and the angle at Λ = the angle at H, therefore the triangles $[Z\Theta\Lambda, E\Gamma H]$ are equiangular;

$$\begin{array}{ll} \therefore & \Lambda Z : \Theta Z = \operatorname{EH} : \operatorname{E}\Gamma, \\ i.e., & \Lambda \Delta : Z\Theta = \operatorname{EH} : \operatorname{E}\Gamma; \\ \therefore & \Lambda \Delta^2 : Z\Theta^2 = \operatorname{EH}^2 : \operatorname{E}\Gamma^2 \\ & = \operatorname{HE} \cdot \operatorname{E}Z : \operatorname{BE} \cdot \operatorname{E}\Gamma^b \\ & = \operatorname{AE} \cdot \operatorname{E}\Delta : \operatorname{BE} \cdot \operatorname{E}\Gamma. \end{array}$$

[Eucl. iii. 35

And [therefore] the ratio AE.E Δ : BE.E Γ is

 b Because, on account of the similarity of the triangles HTE, ZBE, we have HE : ET = EZ : EB.

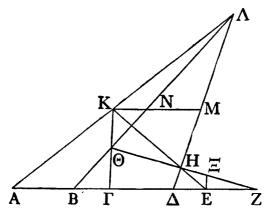

vol. II 2 R 609

ΕΓ μοναχὸς καὶ ἐλάσσων λόγος, ἡ δὲ ZΘ ἡ ὑπεροχὴ ἢ ὑπερέχει ἡ δυναμένη τὸ ὑπὸ τῶν ΑΓ, BΔ τῆς δυναμένης τὸ ὑπὸ AB, ΓΔ [τουτέστιν τὸ ἀπὸ τῆς ZK τοῦ ἀπὸ τῆς ΘK], ιωστε ὁ μοναχὸς καὶ ἐλάσσων λόγος ὁ αὐτός ἐστιν τῷ ἀπὸ τῆς AΔ πρὸς τὸ ἀπὸ τῆς ὑπερέχει ἡ δυναμένη τὸ ὑπὸ AΓ, BΔ τῆς δυναμένης τὸ ὑπὸ AB, ΓΔ, ὅπερ: \sim

- a Notice the sign: ~ used in the Greek for έδει δείξαι. In all Pappus proves this property for three different positions of the points, and it supports the view (v. supra, p. 341 n. a) that Apollonius's work formed a complete treatise on involution.
 - ^b v. vol. i. pp. 478-485.
- ^c Following Breton de Champ and Hultsch I reproduce the second of the eight figures in the MSS., which vary according to the disposition of the points.

¹ τουτέστιν . . . της ΘΚ om. Hultsch.

Ἐπεί ἐστιν ὡς τὸ ὑπὸ ΑΖ, ΒΓ πρὸς τὸ ὑπὸ ΑΒ, ΓΖ, οὕτως τὸ ὑπὸ ΑΖ, ΔΕ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ ἐναλλάξ ἐστιν ὡς τὸ ὑπὸ ΑΖ, ΒΓ πρὸς τὸ ὑπὸ ΑΖ, ΔΕ, τουτέστιν ὡς ἡ ΒΓ πρὸς τὴν ΔΕ, οὕτως τὸ ὑπὸ ΑΒ, ΓΖ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ. ἀλλ' ὁ μὲν τῆς ΒΓ πρὸς τὴν ΔΕ συνῆπται λόγος, ἐὰν διὰ τοῦ Κ τῆ ΑΖ παράλληλος ἀχθῆ ἡ ΚΜ, ἔκ τε τοῦ τῆς ΒΓ πρὸς ΚΝ καὶ τῆς ΚΝ πρὸς ΚΜ καὶ ἔτι τοῦ τῆς ΚΜ πρὸς ΔΕ, ὁ δὲ τοῦ ὑπὸ ΑΒ, ΓΖ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ συνῆπται ἔκ τε τοῦ τῆς ΒΑ πρὸς τὸ ὑπὸ ΑΔ, ΕΖ συνῆπται ἔκ τε τοῦ τῆς ΒΑ πρὸς ΑΔ ὁ αὐτὸς ὧν τῷ τῆς ΝΚ πρὸς ΚΜ· λοιπὸν ἄρα ὁ τῆς ΓΖ πρὸς τὴν ΚΕ, τουτέστιν τοῦ τῆς ΘΓ πρὸς τὴν ΚΘ, καὶ τοῦ τῆς ΚΜ πρὸς τὴν ΔΕ, τουτέστιν τοῦ τῆς ΚΗ πρὸς τὴν ΗΕ· εὐθεῖα ἄρα ἡ διὰ τῶν Θ, Η, Ζ.

εὐθεῖά ἐστιν.

^δ Conversely, if HΘKA be any quadrilateral, and any

612

^a It is not perhaps obvious, but is easily proved, and is in fact proved by Pappus in the course of iv. 21, ed. Hultsch 212. 4-13, by drawing an auxiliary parallelogram.

Since AZ . B Γ : AB . Γ Z = AZ . Δ E : A Δ . EZ, permutando

$$AZ \cdot B\Gamma : AZ \cdot \Delta E = AB \cdot \Gamma Z : A\Delta \cdot EZ,$$
 i.e.,
$$B\Gamma : \Delta E = AB \cdot \Gamma Z : A\Delta \cdot EZ.$$

But, if KM be drawn through K parallel to AZ,

$$B\Gamma : \Delta E = (B\Gamma : KN) \cdot (KN : KM) \cdot (KM : \Delta E)$$

and

AB.
$$\Gamma Z : A\Delta$$
. $EZ = (BA : A\Delta)$. $(\Gamma Z : ZE)$.

Let the equal ratios BA : $A\Delta$ and NK : KM be eliminated;

then the remaining ratio

$$\Gamma Z : ZE = (B\Gamma : KN) \cdot (KM : \Delta E),$$

 $i.e., \qquad \Gamma Z : ZE = (\Theta\Gamma : K\Theta) \cdot (KH : HE);$

then shall the line through Θ , H, Z be a straight line. For if through E I draw $E\Xi$ parallel to $\Theta\Gamma$, and if ΘH be joined and produced to Ξ ,

and
$$(\Gamma\Theta:\Theta K) \cdot (\Theta K:E\Xi) = \Theta \Gamma:E\Xi$$
, $\Gamma Z:ZE = \Gamma\Theta:E\Xi$;

and since $\Gamma\Theta$ is parallel to $E\Xi$, the line through Θ , Ξ , Z is a straight line (for this is obvious ^a), and therefore the line through Θ , H, Z is a straight line.

transversal cut pairs of opposite sides and the diagonals in the points $A, Z, \Delta, \Gamma, B, E$, then $B\Gamma : \Delta E = AB \cdot \Gamma Z : A\Delta \cdot EZ$. This is one of the ways of expressing the proposition enunciated by Desargues: The three pairs of opposite sides of a complete quadrilateral are cut by any transversal in three pairs of conjugate points of an involution (v. L. Cremona, Elements of Projective Geometry, tr. by C. Leudesdorf, 1885, pp. 106-108). A number of special cases are also proved by Pappus.

'Η μηχανική θεωρία, τέκνον Έρμόδωρε, πρὸς πολλὰ καὶ μεγάλα τῶν ἐν τῷ βίῳ χρήσιμος ὑπ-άρχουσα πλείστης εἰκότως ἀποδοχῆς ἠξίωται πρὸς τῶν φιλοσόφων καὶ πᾶσι τοῖς ἀπὸ τῶν μαθημάτων περισπούδαστός έστιν, έπειδή σχεδόν πρώτη τής περί την ύλην των έν τω κόσμω στοιχείων φυσιολογίας ἄπτεται. στάσεως γὰρ καὶ φορᾶς σωμάτων καὶ τῆς κατὰ τόπον κινήσεως ἐν τοῖς ὅλοις θεωρηματική τυγχάνουσα τὰ μὲν κινούμενα κατὰ φύσιν αἰτιολογεῖ, τὰ δ' ἀναγκάζουσα παρὰ φύσιν έξω των οἰκείων τόπων εἰς ἐναντίας κινήσεις μεθίστησιν ἐπιμηχανωμένη διὰ τῶν ἐξ αὐτῆς τῆς ὕλης ὑπο-πιπτόντων αὐτῆ θεωρημάτων. τῆς δὲ μηχανικῆς τό μὲν εἶναι λογικὸν τὸ δὲ χειρουργικὸν οἱ περὶ τὸν Ἡρωνα μηχανικοὶ λέγουσιν καὶ τὸ μὲν λογικὸν συνεστάναι μέρος ἔκ τε γεωμετρίας καὶ ἀριθμητικῆς καὶ ἀστρονομίας καὶ τῶν φυσικῶν λόγων, τὸ δὲ χειρουργικὸν ἔκ τε χαλκευτικῆς καὶ οἰκοδομικής καὶ τεκτονικής καὶ ζωγραφικής καὶ τής ἐν τούτοις κατὰ χεῖρα ἀσκήσεως· τὸν μὲν οὖν ἐν ταῖς προειρημέναις ἐπιστήμαις ἐκ παιδὸς γενόμενον κάν ταις προειρημέναις τέχναις έξιν είληφότα πρὸς δὲ τούτοις φύσιν εὐκίνητον ἔχοντα, κράτιστον ἔσεσθαι μηχανικῶν ἔργων εὑρετὴν καὶ ἀρχιτέκτονά φασιν. μὴ δυνατοῦ δ' ὄντος τὸν αὐτὸν μαθημάτων

^a After the historical preface here quoted, much of Book viii. is devoted to arrangements of toothed wheels, already encountered in the section on Heron (supra, pp. 488-497). A 614

(o) Mechanics a

Ibid. viii., Preface 1-3, ed. Hultsch 1022. 3-1028. 3

The science of mechanics, my dear Hermodorus, has many important uses in practical life, and is held by philosophers to be worthy of the highest esteem, and is zealously studied by mathematicians, because it takes almost first place in dealing with the nature of the material elements of the universe. For it deals generally with the stability and movement of bodies about their centres of gravity, b and their motions in space, inquiring not only into the causes of those that move in virtue of their nature, but forcibly transferring [others] from their own places in a motion contrary to their nature; and it contrives to do this by using theorems appropriate to the subject matter. The mechanicians of Heron's school say that mechanics can be divided into a theoretical and a manual part; the theoretical part is composed of geometry, arithmetic, astronomy and physics, the manual of work in metals, architecture, carpentering and painting and anything involving skill with the hands. The man who had been trained from his youth in the aforesaid sciences as well as practised in the aforesaid arts, and in addition has a versatile mind, would be, they say, the best architect and inventor of mechanical devices. But as it is impossible for the same person to familiarize himself with such

number of interesting theoretical problems are solved in the course of the book, including the construction of a conic through five points (viii. 13-17, ed. Hultsch 1072, 30-1084. 2).

^c With Pappus, this is practically equivalent to Heron himself: cf. vol. i. p. 184 n. b.

b It is made clear by Pappus later (vii., Praef. 5, ed. Hultsch 1030. 1-17) that φορά has this meaning.

τε τοσούτων περιγενέσθαι καὶ μαθεῖν ἄμα τὰς προειρημένας τέχνας παραγγέλλουσι τῷ τὰ μηχανικὰ ἔργα μεταχειρίζεσθαι βουλομένω χρῆσθαι ταῖς οἰκείαις τέχναις ὑποχειρίοις ἐν ταῖς παρ'

ξκαστα χρείαις.

Μάλιστα δὲ πάντων ἀναγκαιόταται τέχναι τυγχάνουσιν προς την του βίου χρείαν [μηγανική προηγουμένη της ἀρχιτεκτονης] ή τε τῶν μαγγαναρίων, μηχανικῶν καὶ αὐτῶν κατὰ τοὺς ἀρχαίους λεγομένων (μεγάλα γάρ οδτοι βάρη διά μηχανών παρά φύσιν είς ύψος ανάγουσιν ελάττονι δυνάμει κινοῦντες), καὶ ἡ τῶν ὀργανοποιῶν τῶν πρὸς τὸν πόλεμον ἀναγκαίων, καλουμένων δὲ καὶ αὐτῶν μηχανικών (βέλη γάρ καὶ λίθινα καὶ σιδηρά καὶ τὰ παραπλήσια τούτοις έξαποστέλλεται εἰς μακρὸν όδοῦ μηκος τοῖς ὑπ' αὐτῶν γινομένοις ὀργάνοις καταπαλτικοῖς), πρὸς δὲ ταύταις ἡ τῶν ἰδίως πάλιν καλουμένων μηχανοποιῶν (ἐκ βάθους γὰρ πολλοῦ ὕδωρ εὐκολώτερον ἀνάγεται διὰ τῶν ἀντληματικών δργάνων ών αὐτοί κατασκευάζουσιν). καλοῦσι δὲ μηχανικοὺς οἱ παλαιοὶ καἶ τοὺς θαυμασιουργούς, ὧν οἱ μὲν διὰ πνευμάτων φιλοτεχνοῦσιν, ώς "Ηρων Πνευματικοῖς, οἱ δὲ διὰ νευρίων καὶ σπάρτων ἐμψύχων κινήσεις δοκοῦσι μιμεῖσθαι, ώς "Ηρων Αὐτομάτοις καὶ Ζυγίοις, ἄλλοι δὲ διὰ τῶν ἐφ' ὕδατος ὀχουμένων, ώς 'Αρχι-μήδης 'Οχουμένοις, ἢ τῶν δι' ὕδατος ὡρολογίων, ώς Ήρων Υδρείοις, α δή και τη γνωμονική

¹ μηχανική . . . ἀρχιτεκτονης om. Hultsch.

μάγγανον is properly the block of a pulley, as in Heron's

mathematical studies and at the same time to learn the above-mentioned arts, they instruct a person wishing to undertake practical tasks in mechanics to use the resources given to him by actual experience in his special art.

Of all the [mechanical] arts the most necessary for the purposes of practical life are: (1) that of the makers of mechanical powers, a they themselves being called mechanicians by the ancients-for they lift great weights by mechanical means to a height contrary to nature, moving them by a lesser force; (2) that of the makers of engines of war, they also being called mechanicians—for they hurl to a great distance weapons made of stone and iron and suchlike objects, by means of the instruments, known as catapults, constructed by them; (3) in addition, that of the men who are properly called makers of engines -for by means of instruments for drawing water which they construct water is more easily raised from a great depth; (4) the ancients also describe as mechanicians the *nonder-norkers*, of whom some work by means of pneumatics, as Heron in his Pneumatica, b some by using strings and ropes, thinking to imitate the movements of living things, as Heron in his Automata and Balancings, b some by means of floating bodies, as Archimedes in his book On Floating Bodies. or by using water to tell the time, as Heron in his Hydria, which appears to have affinities with the

Belopoeïca, ed. Schneider 84. 12, Greek Papyri in the British Museum iii. (ed. Kenyon and Bell) 1164 n. 8.

^b v. supra, p. 466 n. a. ° v. supra, pp. 242-257. d This work is mentioned in the Pneumatica, under the title Π ερὶ ὑδρίων ὡροσκοπείων, as having been in four books. Fragments are preserved in Proclus (Hypotyposis 4) and in Pappus's commentary on Book v. of Ptolemy's Syntaxis.

θεωρία κοινωνοῦντα φαίνεται. μηχανικοὺς δὲ καλοῦσιν καὶ τοὺς τὰς σφαιροποιΐας [ποιεῖν] ἐπισταμένους, ὑφ' ὧν εἰκὼν τοῦ οὐρανοῦ κατασκευάζεται δι' ὁμαλῆς καὶ ἐγκυκλίου κινήσεως ύδατος.

Πάντων δὲ τούτων τὴν αἰτίαν καὶ τὸν λόγον έπεγνωκέναι φασίν τινες τὸν Συρακόσιον 'Αρχι-μήδη· μόνος γὰρ οὖτος ἐν τῷ καθ' ἡμᾶς βίῳ ποικίλη πρὸς πάντα κέχρηται τῆ φύσει καὶ τῆ έπινοία, καθώς καὶ Γέμινος ὁ μαθηματικὸς ἐν τῷ Περὶ τῆς τῶν μαθημάτων τάξεώς φησιν. Κάρπος δέ πού φησιν ὁ ἀντιοχεὺς ἀρχιμήδη τὸν Συρακόσιον ἐν μόνον βιβλίον συντεταχέναι μηχανικὸν τὸ κατὰ τὴν σφαιροποιΐαν, τῶν δὲ ἄλλων οὐδὲν ήξιωκέναι συντάξαι. καίτοι παρὰ τοῖς πολλοῖς ἐπὶ μηχανικῆ δοξασθεὶς καὶ μεγαλοφυής τις γενόμενος δ θαυμαστός εκείνος, ώστε διαμείναι παρά πᾶσιν ἀνθρώποις ὑπερβαλλόντως ὑμνούμενος, τῶν τε προηγουμένων γεωμετρικής καὶ ἀριθμητικής έχομένων θεωρίας τὰ βραχύτατα δοκοῦντα εἶναι σπουδαίως συνέγραφεν δς φαίνεται τὰς εἰρημένας επιστήμας οὕτως αγαπήσας ώς μηδεν έξωθεν ύπομένειν αὐταῖς ἐπεισάγειν. αὐτὸς δὲ Κάρπος καὶ ἄλλοι τινὲς συνεχρήσαντο γεωμετρία καὶ εἰς τέχνας τινὰς εὐλόγως γεωμετρία γὰρ οὐδὲν βλά-πτεται, σωματοποιεῖν πεφυκυῖα πολλὰς τέχνας, διὰ τοῦ συνείναι αὐταῖς [μήτηρ οὖν ὥσπερ οὖσα τεχνῶν οử βλάπτεται διὰ τοῦ φροντίζειν ὀργανικῆς καὶ ἀρχιτεκτονικῆς· οὐδὲ γὰρ διὰ τὸ συνεῖναι γεωμορία καὶ γνωμονικῆ καὶ μηχανικῆ καὶ σκηνογραφία βλάπτεταί τι], τουναντίον δε προάγουσα 1 ποιείν om. Hultsch.

² μήτηρ . . . τι om. Hultsch.

science of sun-dials; (5) they also describe as mechanicians the *makers of spheres*, who know how to make models of the heavens, using the uniform circular motion of water.

Archimedes of Syracuse is acknowledged by some to have understood the cause and reason of all these arts; for he alone applied his versatile mind and inventive genius to all the purposes of ordinary life, as Geminus the mathematician says in his book On the Classification of Mathematics.a Carpus of Antioch b says somewhere that Archimedes of Syracuse wrote only one book on mechanics, that on the construction of spheres, onot regarding any other matters of this sort as worth describing. Yet that remarkable man is universally honoured and held in esteem, so that his praises are still loudly sung by all men, but he himself on purpose took care to write as briefly as seemed possible on the most advanced parts of geometry and subjects connected with arithmetic; and he obviously had so much affection for these sciences that he allowed nothing extraneous to mingle with them. Carpus himself and certain others also applied geometry to some arts, and with reason; for geometry is in no way injured, but is capable of giving content to many arts by being associated with them, and, so far from being injured, it is obviously, while itself

^a For Geminus and this work, v. supra, p. 370 n. c.

^b Carpus has already been encountered (vol. i. p. 334) as the discoverer (according to Iamblichus) of a curve arising from a double motion which can be used for squaring the circle. He is several times mentioned by Proclus, but his date is uncertain.

^c This work is not otherwise known.

μέν ταύτας φαίνεται, τιμωμένη δε καὶ κοσμουμένη δεόντως ὑπ' αὐτῶν.

^a With the great figure of Pappus, these selections illustrating the history of Greek mathematics may appropriately come to an end. Mathematical works continued to be written in Greek almost to the dawn of the Renaissance, and

advancing those arts, appropriately honoured and adorned by them.^a

they serve to illustrate the continuity of Greek influence in the intellectual life of Europe. But, after Pappus, these works mainly take the form of comment on the classical treatises. Some, such as those of Proclus, Theon of Alexandria, and Eutocius of Ascalon have often been cited already, and others have been mentioned in the notes.

This index does not include references to critical notes nor to authors cited, for which the separate catalogue should be consulted. References to vol. i. are cited by the page only, those to vol. ii. by volume and page. The abbreviations "incl." = "including" and "esp." = "especially" are occasionally used.

Arrow of Zeno, 367, 371
Astronomy: a full notice excluded, x; identical with sphaeric in the Pythagorean quadrivium, 5 n. b; in the education of Plato's Guardians, 15; in Ana-

tolius and Geminus, 19 and n. b; Isocrates' views, 29; work of Thales, 147 n. a; of Pythagoras, 149 n. b; of Ecphantus, ii. 5 n. b; of Oenopides, 149 n. e; of Philippus of Opus, 155 n. a; of Eudoxus, 15 n. a, 411-415; of Heraclides of Pontus, 15 n. a. ii. 5 n. b: of Autolycus of Pitane and Euclid, 490 n. of Aristarchus Samos, ii. 3-15; of Eratosthenes, ii. 261 n. a, ii. 263 and n. c, ii. 267-273; of Apollonius of Perga, 277 n. a. ii. 357 n. b; of Posidonius, ii. 371 n. b; of Hypsicles, ii. 395-397; of Cleomedes, ii. 399-401; of Hipparchus, ii. 407 n. a, 414 n. a; of Menelaus, ii. 407 n. a; of Ptolemy, ii. 409 and n. b, ii. 447; of Pappus, ii. 593 n. a; knowledge of astronomy necessarv for reading Plato, ii. 401 Athenaeus of Cyzicus, 153 and n. e " Attic" numerals, 41-42

August, E. F., 397 n. a
August, E. F., 397 n. a
Autolycus of Pitane, 491 n. a
Axioms and postulates:
Aristotle's discussion, 419423; Euclid's postulates,
413; attempt to prove the
parallel-postulate, ii. 367385; Archimedes' postulates in his work On the
Sphere and Cylinder, ii.

in his work On45-47, PlaneEquilibriums. 207-209, in his work OnFloating Bodies, ii. 243-245 (incl. n. a); "Archimedes' Axiom," 321 n. a, 411 n. a, 455 n. a, ii. 47 and n. a. ii. 231

Bachet, ii. 537 n. b Barlaam, 14th century Calabrian monk: his formula for approximation to a square root, ii. 472 n. a

Bede, the Venerable, 31 n. c Bees, Pappus on their choice of shape for cell, ii. 589-593

Benecke, A., his Ueber die Geometrische Hypothesis in Platons Menon, 397 n. a Besthorn, R. O.: his edition of an-Nairīzī's commen-

tary on Euclid's Elements, 185 n. b Björnbo, A. A., on Hippo-

crates' quadratures, 311 Blass, C.: his De Platone

mathematico, 387 n. a Boeckh, A., 221 n. a

Boethius, citation of Archytas's proof that a superparticular ratio cannot be divided into equal parts, 131-133

Breton de Champ, P., ii. 611 n. c

Bretschneider, C. A., his Die Geometrie und die Geometer vor Eukleides, 153 n. a

Brochard, V., on Zeno's paradoxes, 367 n. a

Bryson, attempt to square the circle, 315-317

Burnet, J., on the astronomy in Plato's Republic, 15 n. a Butcher, S. H., on the hypothesis in Plato's Meno. 397 n. a

Callimachus, ii. 261 and n. b Canonic, theory of musical intervals, 19 and n. b Cantor, G., 42

Carpus of Antioch, 335, ii. 619

Case (πτῶσις), ii. 347

Casting out of nines, 107-109 Catasterismi, work by Eratosthenes, ii. 263 n. a

Catoptrics, v. Euclid: Works Cattle-problem, v. medes: Works

Centre of gravity: Archimedes' postulates, ii. 209: of a lever, ii. 209-217; of a parallelogram, ii. 217-221; of a triangle, ii. 217 n. b, ii. 227 and n. a; of a trapezium and parabolic segment, ii. 217 n. b; of a segment of a paraboloid, ii. 225

Chaldaeans, ii. 397 n. a

Chasles, M., 485 n. e, ii. 581 n. c

Chords, Table of: Hipparchus and Menelaus, ii. 407, ii. 409 and n. a; Ptolemy, ii. 443-445

Chrysippus, 229 n. a

Cicero: restored monument to Archimedes, ii. 33 n. a

Circle:

Division into degrees, ii. 395-397

Squaring of the circle: Anaxagoras's work in prison, 309; a reference by Aristophanes, 309: approximation by polygons — Antiphon, 311-315, Bryson, 315-317, Archimedes, 317 - 333: solutions bv higher Simplicius's curves summary. 335. quadratrix. 337 - 347; approximations by Archimedes, 333 n. a. and Apollonius, ii. 353; Pappus's collection of solutions, ii. 581 n. b

Apparent form of circle, ii. 593-597

Cissoid, viii; discovered by Diocles, 271 n. a, ii. 365 n. a; and by him used for finding two mean proportionals, 271-279

Cleanthes, ii. 5

Cleomedes: life and works, ii. 267 n. b, ii. 397 n. a; on the measurement of the earth, ii. 267-273; on paradoxical eclipses, ii. 397-401

Cleonides, 157 n. c Cochlias, 335, ii. 351

Cochloids, 301 n. a, 335 and n. c, 297 n. c

Commandinus, his edition of Pappus's Collection, 499 n. a, ii. 581 n. c

Concentric spheres, Eu-

doxus's theory of, 411-415

Conchoid, 297, 301 n. a; used by Nicomedes to trisect an angle, 297-309

Cone: double cone defined by Apollonius, ii. 285-287; single cone defined, ii. 287; volume enunciated by Democritus, 229-231; and proved by Eudoxus, 229-231, 409-411; subcontrary section a circle, ii. 301 n. a

Conic sections: discovered by Menaechmus, 279-283 (incl. n. a), 297, ii. 281 n. a; originally called sections of a right-angled. acute-angled and obtuseangled cone, 283 n. a, ii. 279; by Apollonius renamed parabola, ellipse and hyperbola, 283 n. a; treatises written by Aristaeus and Euclid, 487 and n. a, ii. 255 n. a, ii. 281 n. a: "locus with respect to three or four lines," 487-489; Euclid on generation of ellipse, 491; focusdirectrix property assumed by Euclid, 495 and n. a; terminology of Archimedes, ii. 281 n. a, ii. 283 n. a: area of parabolic segment found by Archimechanically, ii. medes 223-227, ii. 233-239, geometrically, ii. 239-245: properties assumed Archimedes, ii. 171, ii. 175,

ii. 253, ii. 255; relation of Apollonius's treatise to previous works, ii. 277-281: scope of his treatise. ii. 281-285; definitions, ii. 285-289; construction of the sections, ii. 289-305: fundamental properties, ii. 305-329; meaning of diameter, ii. 287; ordinates, ii. 289; conjugate diameters, ii. 289: transition to new diameter, ii. 329-335: principle axes, ii. 289 and n. a, ii. 331 n. a; conjugate axes, ii. 289; opposite branches of hyperbola, ii. 323-329 (incl. n. a): basis of Apollonius's treatment the application of areas, ii. 309 n.a: "figure" of a conic section, ii. 317 n. a; latus rectum, ii. 309 and n. a, ii. 317 and n. a; transverse side, ii. 317 and n. a: Cartesian equivalents, 283 n. a, ii. 323 n. a; use of conic sections to solve cubic equations—by Archimedes, ii. 137-159; Dionysodorus Diocles, ii. 163 n. a; to find two mean proportionals, 279-283: to trisect an angle, 357-363

Conon of Samos, ii. 35 n. b, ii. 229

Conversion, in geometry, 159 and n. a

Cube: one of five regular solids, 217, 223, 379, 467-475; inscription in sphere

by Pappus, ii. 575 n. a; duplication of cube—task set to Delians and Plato's advice sought, 257; a poetic version, 257-259; reduced to finding of two mean proportionals, 259; collection of solutions by Eutocius, 263 n. a; by Pappus, ii. 581 n. b

Cube root: ³ √100 found by Heron, 61-63; Heron's value for ³√97050, 63 n. a; approximations by Philon of Byzantium, 63 n. a

Cubic equations: c.e. arising out of Archimedes' Sph. et Cyl., ii. 133 n. d; solved by Archimedes use οf conics. 137-159 (esp. 141 n. a); also by Dionysodorus and Diocles, ii. 163 n. Archimedes able to find real roots of general cubic. ii. 163 n. *a* ; cubic equation solved by Diophantus, ii. 539-541

Damianus of Larissa, ii. 497 n. a; his book On the Hypotheses in Optics, ii. 497; an abridgement of a larger work based on Euclid, ii. 497 n. a

Definitions: discussed by Plato, 393; by Aristotle, 423; Euclid's d., 67-71, 437-441, 445-453, 479; Archimedes' d., ii. 43-45, ii. 165, ii. 183-185: Apollonius's d., ii. 285-289;

Heron's d., ii. 467-471; Diophantus's d., ii. 519-523 De Fortia D'Urban, Comte, his Traité d'Aristarque de Samos, ii. 15 n. b Demel, Seth: his PlatonsVerhältnis Mathezurmatik, 387 n. a Demetrius of Alexandria, 349 and n. b Democritus: life and works. 229 n. a: reflections on the indefinitely small, 229: enunciated formulae for volumes of cone and pyramid, 229-231, 411 n. a De Morgan, 447 n. a Descartes, system of co-ordinates conceived through study of Pappus, ii. 601 n. a Dichotomy of Zeno, 369 and n. b Diels, H.: his Die Fragmente der Vorsokratiker, xvi, 5, 73, 75, 113, 173, 217 Digamma: use as numeral, 43 Dimension, 85, ii. 411-413, ii. 515. ii. 601-603 Dinostratus, 153 and n. d Diocles: his date, ii. 365 n. a; his discovery of the cissoid. viii, 270-279; his solution of a cubic equation, ii. 135, ii. 163 n. **a** Diodorus of Alexandria: his Analemma, 301 and n. bDiodorus Siculus: his account of the siege Syracuse, ii. 23 and n. a Dionysius, a friend of Heron,

163 n. a; his book On the Spire, ii. 481 Diophantus of Alexandria: life, ii. 513, ii. 517 n. b; on the unit, ii. 515; on the Egyptian method of reckoning, ii. 515; Arithmetica, ii. 517 and n. b; his work (?) entitled Porisms, ii. 517 and n. c; his treatise On Polygonal Numbers, ii. 515, ii. 561; his contributions to algebra-notation, ii. 519-525: pure determinate equations, ii. 525; quadratic equations, ii. 527-535, esp. ii. 533; simultaneous equations leading to a quadratic, ii. 537; cubic equation, ii. 539-541; indeterminate analysis, 139 n. b: indeterminate equations of the second degree, ii. 541-547; indeterminate equations of higher degree, ii. 549-551; theory of numbers—sums of squares, ii.

ii. 364 n. a; his solution of

a cubic equation, ii. 135, ii.

Dioptra: ancient theodolite, ii. 467; Heron's book, ii. 485-489

551-559

Diorismi, 151 and n. h, 395-397, ii. 135 n. a

Division in Greek mathematics, 51-61

Division of Figures: Euclid's book, 157 n. c: a problem in Heron's Metrica, ii. 483-485

ii. 467

Dionysodorus: of Caunus?,

Dodecahedron: one of the five regular solids, 217, 223 and n. b; Hippasus said to have been drowned for revealing it, 223-225; comparison with the icosahedron, ii. 349 Dositheus Pelusium: of works dedicated to him by Archimedes, ii. 41, ii. 229 Dyad, 75 and n. a, 427 n. bEarth: circumference calculated by Posidonius, ii. 267; by Eratosthenes, ii. 267-273 Ecliptic, 149 n. e Ecphantus, ii. 5 n. b Eecke, Paul Ver, v. Ver \mathbf{Eecke} Egyptian method of reckoning, 17, 21, ii. 515-517 Egyptian papyri, calculations in, 45-47 Egyptian se-get, 165 n. b Elements: meaning of term, 151 n. c; Leon's collection, 151; Euclid's Ele-157, 437-479; Elements of Conics, 487 n. a, ii. 151, ii. Pappus's Collection so described, ii. 607 Eneström, G., 63 n. a Enneagon: relation of side of enneagon to diameter

 $(=\sin 20^\circ)$, ii. 409 n. a

Thymaridas, 139-141
Equations: v. Cubic equa-

tions, Quadratic equations

achievements, 156 and n.a.

Epanthema,

Eratosthenes:

" bloom,"

Life

ii. 261 and n. a; his work On Means included in the Treasury of Analysis, ii. 263 and n. d; discussed loci with reference to means. ii. 263 n. d, ii. 265 and n. a; his *Platonicus*, 257 and ii. 265-267; his sieve for finding successive odd numbers, 100-103; letter of pseudo - Eratosthenes Ptolemy Euergetes, 257-261; his solution of the problem of two mean proportionals, 291-297; his solution derided by Nicomedes, 297-299; measurement of the circumference of the earth, ii. 267-273; Archimedes' Method dedicated to him, ii. 221; Cattle Problem said to have been sent through him, ii. 203; his teachers and pupils, 261-263; his nicknames, 261-263; his works, ii. 263

Erycinus, Paradoxes of, ii. 571-573

Euclid:

Life: Born in time of Ptolemy I, 155 and n. b; not to be confused with Euclid of Megara, 155 n. b; his school at Alexandria, 437 n. a, 489, ii. 35 n. b; told Ptolemy there was no royal road in geometry, 155 (but v. n. b); contempt for those who

studied mathematics for monetary gain, 437 Works:

Elements: meaning of the name, 151 n. c, Proclus's notice, 155-157: definitions, postulates and common notions. 437-445; " Pythagoras's Theorem," 179-185; application of areas, 187-215; theory of proportion. 445-451: arithmetical definitions, 67-71; theory of incommensurables, 451-459: method of exhaustion, 459-465; regular solids, 467-479; Proclus's commentary on Book i.,

Thirteen Books, etc.
Data: General character, 479 n. a; definitions, 479; included in Treasury of Analysis, 479 n. a, ii. 337; cited, ii. 455

145 n. a : an-Nairīzī's

commentary, 185 n. b; Scholia, 215-217, 379,

409; T. L. Heath, The

Euclid's Elements: v.

Heath, T. L.:

Books

Thirteen

Porisms: Proclus's notice, 481; included in Treasury of Analysis, 481 and n. c, ii. 337; Pappus's comprehensive enuncia-

tion, 481-483; developments in theory of conics, 487 n. a; modern reconstructions, 485 n. e; a lemma by Pappus, ii. 611-613

Conics: a compilation based on Aristaeus, ii. 281 n. a; Pappus on Apollonius's debt, 487-489; ellipse obtained as section of cone or cylinder by a plane not parallel to the base, 491 and n. b; focus-directrix property assumed without proof, 495 n. a; cited by Archimedes, ii. 2925

Surface Loci: 399 n. a, 487 n. a; included in Treasury of Analysis, 491 and n. c; Pappus's lemmas, 363 n. a, 493-503

Optics: Euclid's text and Theon's recension, 503 and n. b, 157 and n. c; proof that $\tan a : \tan \beta < a : \beta$, 503-505

On Divisions of Figures: Proclus's notice, 157; Woepcke's discovery of Arabic text, 157 n. c; R. C. Archibald's restoration, 157 n. c; a medieval Latin translation (by Gherard of Cremona?),

157 n. c; similarity of Book iii. of Heron's *Metrics*, ii. 485 n. a; division of a circle into three equal parts, ii. 485 n. a

Pseudaria: attributed to Euclid by Proclus, 161 and n. a

Catoptrics: attributed to Euclid by Proclus, 157; but not otherwise known, and possibly written by Theon of Alexandria, 157 n. c Phenomena: astronomical treatise, 491 n. a Sectio Canonis, musical treatise doubtfully attributed to Euclid,

Introductio Harmonica, musical treatise by Cleonides, wrongly attributed to Euclid, 157 n. c

157 n. c

Elements of Music: attributed to Euclid by Proclus, 157

Euclidean geometry, viii; its nature defined in the postulates—space an infinite, homogeneous continuum, 443 and nn. a. b, the parallel-postulate, 443 and n. c; Proclus's objection to the postulate, ii. 367-371; attempts to prove the postulate—Posidonius and Geminus, ii. 371-373, Ptolemy, ii. 373-383, Proclus, ii. 383-385;

Euclid's genius in making it a postulate, 443 n. c, ii. 367 n. a; non-Euclidean geometry, 443 n. c

Eudemus: pupil of Aristotle, 145 n. a, ii. 281; his History of Geometry, 145 n. a; his account of Hippocrates' quadrature of lunes, 235-253; on sum of angles of a triangle, 177-179; attributed Eucl. xii. 2 to Hippocrates, 239, 459 n. a

Eudemus, correspondent of Apollonius: Conics dedicated to him, ii. 281

Eudoxus of Cnidos: clus's notice, 151-153; discovered three subcontrary means, 153;increased theorems about "the section," 153; established theory of proportion, 409: credited with discovery of three subcontrary means, 121 n. a; gave proofs of volume of pyramid and cone, 409-411; must have used "Axiom of Archimedes," 411 n. a, ii, 231; established method of exhausting an area by polygons, 411 n. a; his theory of concentric spheres to account for planetary motions, 411-415; naechmus his pupil, 153; his work continued by Hermotimus of Colophon. 153; otherwise mentioned. 349 n. c

Eugenius Siculus, Admiral, translated Ptolemy's Optics into Latin, ii. 411 n. a

Euripides, 259 n. a

Eutocius: On Archimedes'
Sphere and Cylinder, 263
nn. a and b, 277 n. a,
299 n. a, ii. 159 n. a, ii.
163 n. a, ii. 621 n. a;
On A.'s Measurement of
a Circle. 323 n. a

Exhaustion, method of; originated by Antiphon, 315 n. a; or possibly by Hippocrates, 411 n. a; established by Eudoxus, 315 n. a, 411 n. a; used to prove that circles are to one another as the squares on their diameters, 239 n. b, 459-465; used for approximating to area of circle, 313-315

Fermat: reconstruction of Apollonius's On Plane Loci, ii. 345 n. c; his notes on Diophantus, ii. 551 n. a; sums of squares, ii. 559 n. b

Fractions in Greek mathematics, 45

Geèponicus, Liber, ii. 467 n. a, ii. 505 n. b

Geminus: life and works, ii. 371 n. c; on the classification of curves, ii. 361-363, ii. 365 nn. a and b; his attempt to prove the parallel-postulate, ii. 371 n. c

Geometric mean: v. Means Geometry: origins of, 145 (incl. n. b)-146; Proclus's summary, 145-161; Plato on its nature, 9-11; included in theoretical part of mechanics by Heron, ii. 615; for detailed subjects v. Table of Contents

Gnomon: in sundials, 87 n. a, ii. 269-271; gnomons of dots in figured numbers, 87 n. a, 93 n. a, 95 and n. b, 99 and n. a; gnomon of a parallelogram, 193 and n. b, 197 n. a

Gow, J., A Short History of Greek Mathematics, 43 n. b Guldin, Paul, ii. 605 n. a Guldin's Theorem, ii. 605 (incl. n. a)

Halley, E., 485 n. b, ii. 337 n. a, ii. 339 n. b Harmonic mean: v. Means

Heath, T. L. (later Sir

Thomas):

A History of Greek Mathematics, x, xvi, 5 n. b, 23 n. a, 27 n. c, 35 nn. a and b, 43 n. b, 93 n. a, 107 n. a, 117 n. a, 139 n. b, 145 nn. a and b, 153 n. a, 155 n. b, 157 n. a, 165 nn. a and b, 169 n. a, 237 n. b, 247 n. a, 271 n. a, 311 n. b, 315 n. a, 337 n. a, 357 n. a, 457 n. a, 485 n. e, ii. 163 n. a, ii. 253 n. a, ii. 273 n. c, ii. 341 n. a, ii. 343 n. b, ii. 347 n. a, a

ii. 371 n. c. ii. 407 n. a. ii. 467 n. a. ii. 489 n. a. ii. 525 n. b. ii. 587 n. c. ii. 589 n. a, ii. 605 n. b A Manual of Greek Mathematics, 181 n. a The Thirteen Books of Euclid's Elements. 67 n. a, 71 n. b, 85 n. a, 155 n. b, 159 n. b, 167 n. b, 181 n. a, 195 n. a, 211 n. a, 215 n. a, 437 nn. a and c, 441 n. a, 447 n. a, 457 n. a. ii. 367 n. a Aristarchus of Samos, 411 n. b. 415 n. c. ii. 3

ii. 351 n. a, ii. 357 n. a,

n. a
The Works of Archimedes,
17 n. c, 61 n. b, 323 n. a,

The Method, ii. 19 n. a Apollonius of Perga, ii. 281 n. a

Diophantus of Alexandria, 139 n. b, ii. 513 n. a, ii. 517 n. c, ii. 519 n. a, ii. 523 n. a, ii. 537 n. b Greek Astronomy, 157 n. a, 411 n. b

Heiben, J. L., 333 n. a Heiberg, J. L., 19 n. c, 297 n. a, 311 n. b, 487 n. b, 503 n. b, ii. 81 n. a. ii. 85 n. a, ii. 89 n. a, ii. 159 n. a, ii. 173 n. a, ii. 221 n. b, ii. 243 n. a, ii. 285 n. a, ii. 353 n. c, ii. 357 n. a, ii. 466 n. a Helicon of Cyzicus, 263 n. b Hendecagon, ii. 409 n. a Heraclides of Pontus, ii. 5 n. b Hermodorus, correspondent of Pappus, ii. 597

Hermotimus of Colophon, 153 and n. e

Herodotus, on the abacus, 35 Heron of Alexandria:

Life: his date a disputed question, ii. 467 n. a; described as "the father of the turbine," ii. 467

Works, ii. 467 n. a:

Definitions: based on Euclid, ii. 467; definition of a point, ii. 469; of a spire, ii. 469; his terminology different from Proclus's, ii. 471 n. a

Metrica: discovery by R. Schöne and edited by his son H. Schöne. ii. 467 n. a; has preserved its original form more closely than Heron's other geometrical works, ii. 467 n. a: formula $\mathcal{N}'s(s-a)(s-b)(s-c)$ for area of a triangle, ii. 471-477, ii. 603 a:formula for approximation to square root, ii. 471-472 (incl. n. volume of a spire, ii. 477-483; division of circle into three equal parts, ii. 483485; similarity between Book iii. and Euclid's book On Divisions of Figures, ii. 485 n. a; extraction of a $^3\sqrt{100}$, 60-63; Archimedes' approximation to π , 333 inptra: the dioptra, an instrument like a theo-

Dioptra: the dioptra, an instrument like a theodolite, ii. 467 n. a; measurement of irregular area, ii. 485-489; problem of moving a given force by a given weight using an arrangement toothed wheels. ii. 489 - 497 : similar solutions found in the Mechanics and Pappus, ii. 489 n. a; proof of formula for area of a triangle, ii. 477 n. a

Mechanics: has survived in Arabic, ii. 488 n. a, and in a few fragments of the Greek, ii. 467 n. a; problems discussed, ii. 489 n. a

Geometrica: quadratic equations, ii. 503-505; indeterminate analysis, ii. 505-509 Pneumatica, Automata, etc., ii. 467 n. a, ii. 617

Pneumatica, Automata, etc., ii. 467 n. a, ii. 617 Otherwise mentioned: his addition to "Pythagoras's Theorem," 181 n. a and 185 n. b; his solution of the problem of two mean proportionals, 267-271: possible censure by Pappus, ii. 603 and n. a; on branches of mechanics, ii. 615

Hexagon, its use by bees, ii. 589-593

Hipparchus: life and achievements, ii. 407 n. a; founded the science of trigonometry, ii. 407 n. a; drew up a table of sines, ii. 407 and n. a; discovered precession of the equinoxes, ii. 407 n. a; his Commentary on the Phenomena of Eudoxus and Aratus, ii. 407 n. a, ii. 415 n. a

Hippasus, a Pythagorean: credited with discovery of means, 153 n. a; said to have been drowned at sea for revealing secret of inscribing a dodecahedron in a sphere, 223-225 (incl. n. a) Hippias of Elis: life and achievements, 149 n. a; his praise of Ameristus, 149; discovered the quadratrix, 149 n. a, 337 n. a Hippocrates of Chios: life

and achievements, 235; his quadrature of lunes, 235-253; the views of Aristotle and the commentators on his quadratures, 311 and n. b; first reduced the problem of doubling the cube to the

problem of finding two mean proportionals, 253, 259; possibly able to solve a quadratic equation, 245 n. a; discovered that circles are to one another as the squares on their diameters, 239 and n. b, 459 n. a

Hippopede ("horse-fetter"), name given by Eudoxus to a curve, 415

Homer, 31 n. a

Horsley, S., ii. 347 n. a
Hultsch, F.: his edition of
Pappus's Collection, ii.
565 n. a, ii. 581 n. c, ii. 603
n. b, ii. 611 n. c

Hypatia: daughter of Theon of Alexandria, 48 n. a; helped him in revision of commentary on Ptolemy, 48 n. a; her commentary on Apollonius's Conics, ii. 285 n. a; her commentary on Diophantus's Arithmetica, ii. 517 n. b

Hypotenuse: square on, 179-185; parallelogram on, ii. 575-579

Hypsicles: date, ii. 397 n. a; his division of the circle into 360 degrees, ii. 395-397; his continuation of Euclid's *Elements*, ii. 349 nn. a and c, ii. 397 n. a; his definition of a polygonal number, ii. 397 n. a, ii. 515 and n. b

Iamblichus: on squaring of the circle, 335; on the "bloom" of Thymaridas, 139 n. b; on a property of the pythmen, 109 n. a Icosahedron, 221 and n. e, ii. 349

Incommensurable: v. Irrational

Indeterminate analysis: Pythagorean and Platonic formulae for right-angled triangles, 90-95; side-and diameter - numbers, 133-139; Archimedes' Cattle Problem, ii. 202-205; Heron's problems, ii. 505-509; Diophantus's problems, ii. 541-551

Indian mathematics, 181 n. a Involution, ii. 341 n. a, ii. 611 n. a

Irrational: Pythagoreans and the irrational, 149 n. c, 215-217, 225 n. a, "irrational diameters," 133-137 (esp. n. a), 399 n. c; proof by Theodorus and Theaetetus of irrationality of $\sqrt{3}$, $\sqrt{5}$. . . $\sqrt{17}$, 381-383; Plato on irrational numbers, 401-403; Aristotle's proof of irrationality of $\sqrt{2}$, 111; Euclid's theory, 451-459; Apollonius's theory of unordered irrationals, ii. 351

Isocrates: on mathematics in Greek education, 27-29 Isoperimetric figures, ii. 387-395, ii. 589-593

Karpinski, L. C., 75 n. a

Keil, 43 n. b Kepler, his investigation of semi-regular solids, ii. 197 n. b; on planets, 411 n. b Koppa, used as numeral, 43 Kubitschek, 35 n. b

Laird, A. G., on Plato's nuptial number, 399 n. b Larfeld, W., on Greek alphabet, 42 n. b

Lemmas: Pappus's collection, ii. 607 (incl. n. b) -613, ii. 565 n. a, 493-503; lemmas to Menelaus's Theorem, ii. 447-459

Leodamas of Thasos: Proclus's notice, 151; Plato said to have communicated method of analysis to him, 151 n. e

Leon: made collection of Elements, and discovered diorismi, 151 and n. h

Line: defined, 437; straight line, 439 and n. a; different species of curved lines ii. 361-363

"Linear" loci and problems, 349

"Linear" numbers, 87 n. a Loci: line loci, surface loci, and solid loci, 491 - 493 (incl. n. a): Surface Loci of Euclid, 349 and n. a, 487 n. a, ii. 601; Solid Loci of Aristaeus, 487, ii. 601

Locus with respect to three or four lines, 487-489; with respect to five or six lines, i. 601-603

Logistic, 7, 17-19

Loria, G.: his Le scienze esatte nell' antica Grecia, 47 n. a, 109 n. a, 139 n. b, 271 n. a Lucian, 91 n. a

Mamereus, 147 n. b

Marinus, his commentary on Euclid's Data, ii. 349, ii. 565 n a

Mathematics, meaning of the term, 3, 401 n. a

Means: three Pythagorean means - arithmetic, geometric, subcontrary, 111-115: subcontrary renamed harmonic, 113; three subcontrary means added. 119-121 (incl. n. a): five further means discovered, 121-125; Pappus's equations between means, 125-129 : Plato on means between two squares or two cubes, 129-131; duplication of cube reduced to problem of two mean proportionals, 259 and n. b; solutions, 261-309; Eratosthenes' work On Means, ii. 263; loci with reference to means, ii. 265 and n. a; representation of means by lines in a circle, ii. 569-571 (incl. n. a)

Mechanics: Pappus on branches of mechanics, ii. 615-621: principle of lever, 431-433, ii. 209-217; parallelogram of velocities, 433; centres of gravity, ii. 207-221: five mechanical

powers, ii. 489 n. a: Archimedes' mechanical inventions, ii. 19-31; movement of larger weight by smaller by use of engaging wheels, ii. 489-497; Plato's dislike of mechanical solutions, 263 n. b; Archimedes' preference for theoretical mathematics, ii. 31, ii. 619; pseudo-Aristotelian Mechanics, 431-433; Archimedes' On Plane Equilibriums.ii. 207 - 221 : his mechanical method in mensuration, ii. 221-229, ii. 233-239 : Heron's Mechanics, ii. 467 n. a. ii. 489 (incl. n. a) -497

Menaechmus: solution of problem of two mean proportionals, 261, 279-283; discovered the conic sections, 283 n. a, 297 and n. b, ii. 281 n. a

Menelaus of Alexandria; made an observation under Trajan, ii. 407 n. a; discovered a curve called "paradoxical," 348-349 (incl. n. c); his Sphaerica, ii. 407 n. a, ii. 463 n. a; drew up a table of sines, ii.

407; "Menelaus's Theorem," ii. 459-463

Mensuration: area of triangle given the sides, ii. 471-477; volume of spire, ii. 477-483; measurement of irregular area, ii. 485-489; area of parabolic segment, ii. 223-229, ii. 243 Meton, 309 and n. a Metrodorus, ii. 513 n. a Minus, Diophantus's sign for, ii. 525

Moeris, 175

Multiplication in Greek mathematics, 48; Apollonius's continued multiplications, ii. 353-357

Music: theoretical music (canonic) included by Greeks in mathematics, x, 3 n. b, 19 n. b; full discussion excluded, x; included in Pythagorean quadrivium, 5; in Plato's curriculum for the Guardians, 17; popular music, 3, 19 Musical interval, 3 n. b, 113 n. b, 175

Myriad; notation, 44-45; orders and periods of myriads in Archimedes' notation, ii. 199-201

Nagl, A., 35 n. b

an-Nairīzī, Arabic commentator on Euclid's Elements, 185 n. b, ii. 467 n. a Neoclides, 151 and n. h

Nesselmann, G. F., his Die Alyebra der Griechen, 139 n. b, ii. 513 n. a, ii. 517 n. b Newton, Sir Isaac, ii. 343 n. b Nicolas Rhabdas: v. Rhabdas

Nicomachus of Gerasa, 67 n. b, 69 nn. a and c. 75 n. a, 79 n. a, 81 n. a, 87 n. a, 95 n. b, 101 n. a, 103 n. a, 105 n. a, 107 n. a, 121 n. a, 123 n. c

Nicomedes: date, 297 n. c; his conchoid and its use for finding two mean proportionals, 297-309

Nix, L., ii. 285 n. a

Number: defined by Euclid, 67: by Nicomachus, 73: fundamental concepts, 67-Plato on nature of number, 7; his nuptial number, 399; on generation of numbers, 401-405; odd and even numbers, 67-69, 101, 391; prime numbers, 69, 87 n. a. 101-103: classification of numbers, 71, 73-75; perfect numbers, 71, 75-87; figured numbers, 87-99; properties of numbers, 101-109: Diophantus on sums of squares, ii. 551-559; on polygonal numbers, ii. 515, ii. 56T

Numerals, Greek, 41-45

"Oblong" numbers, 95 (incl. n. b)

Octads, in Archimedes' system of enumeration, ii. 199-201

Octahedron, one of the five regular solids, 217, 221 and n. d

Odd and even numbers: v. Number

Oenopides of Chios, 149 and n. c

Olympiodorus, proof of equality of angles of incidence and reflection, ii. 503 n. a

Optics: Euclid's treatise, 157 n. c, 503 n. b; his theorem about apparent sizes of equal magnitudes, 503-505; Ptolemy's treatise, ii. 411 and n. a, ii. 503 n. a; Heron's treatise, ii. 503 n. a; his proof of equality of angles of incidence and reflection, ii. 497-503; Damianus's treatise, ii. 497 n. a

Pamphila, 167-169 (incl. n. a)

Pappus of Alexandria:

Life: Suidas's notice, ii. 565-567; date, ii. 565 and n. a

Works:

Synagoge or Collection, 145 n. a, ii. 565 n. a; contents--Apollonius's continued multiplications, ii. 353-357; problems and theoii. 567-569; rems, of theory means. ii. 569-571; equations between means. 125-129: paradoxes of Erycinus, ii. 571-573; regular solids, ii. 573-575; extension of Pythagoras's theoii. 575-579; circles inscribed in the $\tilde{a}\rho\beta\eta\lambda$ os, ii. 579-581: duplication of the cube, 299-309; squaring of the circle, 337-347; spiral on

sphere, ii. 581-587; trisection of an angle, 347-363: isoperimetric figures, ii. 589-593; apparent form of a circle. ii. 593-597: "Treasury of Analysis," ii. 597, ii. 599-601, 479 n. a, 481 n. c, 491 n. c, ii. 263, ii. 337; on the works of Apollonius. ii. 337-317. 487-489; locus with respect to five or six lines, ii. 601-603; anticipation of Guldin's theorem, ii. 605-607; lemmas to the Det-rminate Section of Apollonius, ii. 607-611; to the Porisms of Euclid, ii. 611-613; to the Surface Loci of Enclid. 493-503; chanics, ii. 615-621 Commentary on Ptolemy's Syntaxis, 48, ii. 409 n. b, ii. 565-567, ii. 617 n. d Commentary on Euclid's *Elements*, ii. 565 n. a, 457 n. a Commentary on Analemma of Diodorus, 301, ii. 565 n. a Other works, ii. 565 (incl. n. a), 567 Paradoxes of Erycinus, ii. 571-573 Parallelogram of velocities, 433

Parmenides, 367 n. a

Pebbles, used for calculating, Pentagon, regular, 223 n. b Pentagram, Pythagorean figure, 225 and n. b "Perfect" numbers, 71, 75-87 Perseus: life, ii. 365 n. a: discovered spiric curves, ii. 363-365 Phenomena of Eudoxus and 1ratus, 11, 407 n. a: for Euclid's Phenomena, Euclid: Works Philippus of Opus (or Medma), 155 and n. a Philolaus, ii. 3 n. a Philon of Byzantium: solution of problem of two mean proportionals, 263 n. a, 267 n. b: cube root. 63 n. a Philoponus, Joannes. quadrature of lunes, 311 Planisphaerium: v. Ptolemy Plato: his inscription over the doors of the Academy, 387 and n. b; his belief that "God is for ever playing the geometer," 387: his dislike of mechanical constructions, 263 n. b. 389; his identification of the Good with the One, his philosophy mathematics, 391-393; the problem in the Meno, 395-397; the Nuptial Number in the Republic, 399; on the generation of numbers. 401 - 405; his reported

solution of the problem of

two mean proportionals, 263-267; his application of analysis to theorems about "the section," 153 and n. a; his knowledge of side- and diameter-numbers, 137 n. a. 399 n. c; his formula for the sides of right-angled triangles, 93-95, his definition of a point, ii. 469 n. a; his use of the term mathematics, 3 n. c. 401 n. a: his curriculum for Guardians in the Republic. 7-17: Proclus's notice. Theo-151: taught by dorus, 151 n. b; his pupils -Eudoxus, 151, Amyclas of Heraclea, 153, Menaechmus, 153, Philippus, 155: Euclid said to have been a Platonist, 157 and n. b: modern works on Plato's mathematics, 387 n. a. 397 n. a. 399 n. a. 405 n. b "Platonic" figures: v. Regular Solids

"Playfair's Axiom," ii. 371

Plutarch: on parallel section of a cone, 229 and n. a; on Plato's mathematics, 263 n. b, 387-389 Point, 437, ii. 469 and n. a Polygonal numbers. 95-99,

ii. 396 n. a, ii. 515, ii. 561 Pontus, paradoxical eclipses

near, ii. 401 Porism, 479-481

Porisms: v. Euclid: Works, and Diophantus of Alexandria Posidonius: life and works, ii. 371 n. b; on the size of the earth, his definition of parallels, ii. 371-373

Postulates: v. Axioms and

postulates

Prime numbers: v. Number Problems: plane, solid, linear, 349; distinction between problems and theorems, ii. 567

Proclus: life, 145 n. a; his Commentary on Euclid i., 145 n. a; summary of history of geometry, 145-161; his Commentary on Plato's Republic, 399 n. a; his criticism of the parallel-postulate, ii. 367-371; his attempt to prove the parallel-postulate, ii. 383-385

Proof: Aristotle on rigour of geometrical proof, ii. 369; Archimedes on mechanical and geometrical proofs,

ii. 221-223, ii. 229

Proportion: Pythagorean theory of proportion and means, 111-125, 149; Eudoxus's new treatment applicable to all magnitudes, 409 and 447 n. a; Euclid's treatment, 445-451; v. also Means

at the base of an isosceles triangle are equal, 165; that the vertical and opposite angles are equal, 167; that the angle in a semicircle is a right angle, 167-169; his method of finding distance of ships at sea, 167 and n. b

Theaetetus: life, 379 and n. a; Proclus's notice, 151; Suidas's notice, 379; his work on the regular solids, 379 and n. c; on the irrational, 381-383

Themistius: on quadrature of lunes, 310 n. b; on oblong and square numbers,

95 n. b

Theodorus of Cyrene: life, 151 n. b, 381 n. b; Proclus's notice, 151; his proof of incommensurability of $\sqrt{3}, \sqrt{5}...\sqrt{17}$, 381 and n. c

Theodosius: his Sphaerica, ii. 407 n. a

Theodosius I, Emperor, ii. 565 and n. a

Theon of Alexandria: flourished under Theodosius I, 48 n. a, ii. 565; father of Hypatia, 48; to be distinguished from Theon of Smyrna, ii. 401 n. a: his commentary on Ptolemy's Syntaxis, 48, ii. 409 n. b, ii. 565-567, ii. 621 n. a

Theon of Smyrna: referred to as "Theon the mathematician" by Ptolemy, ii. 401; made observations under Hadrian, ii. 401 and n. a; referred to as "the old Theon" by Theon of Alexandria, ii. 401 n. a

Theophrastus, 217 n. c

Theorems, distinction from problems, ii. 567

Theudius of Magnesia, 153 Thymaridas: an early Pythagorean, 139 n. b; his "bloom," 139-141; on prime numbers, 87 n. a

Timaeus of Locri, 219 n. a

Tore (also spire, or anchorring): defined, ii. 365, ii. 469: used by Archytas for the doubling of the cube, 285-289; sections of (Perseus), ii. 363-365; volume of (Dionysodorus and Heron), ii. 477-483

Treasury of Analysis: v. Pappus: Works

Pappus: Works Triangle: angles at base of an isosceles triangle equal, 165 and n. b; equality of triangles, 167 and n. b; sum of angles equal to two right angles, 177-179, ii. 279; "Pythagoras's Theorem," 179-185; extension by Pappus, ii. 575-579; Heron's formula $\sqrt{s(s-a)(s-b)(s-c)}$ for area, ii. 471-477, ii. 603 n. a Triangular numbers, 91-95

Trigonometry: origins in sphaeric, ii. 407 n. a; developed by Hipparchus and Menelaus, ii. 407 and n. a; their tables of sines, ii. 407 n. a, ii. 409 and n. a;

Ptolemy's terminology, ii. 421 n. a: his construction of a table of sines, ii. 413-445; value of sin 18° and sin 36°, ii. 415-419, ii. 421 n. a: of sin 60° , sin 90° , sin 120°, ii. 419-421 (incl. n. a); proof of $\sin^2 \theta$ + $\cos^2 \theta = 1$, ii. 421-423; of " Ptolemy's Theorem," ii. 423 - 425; of sin $(\theta - \phi)$ $=\sin\theta\cos\phi-\cos\theta\sin\phi$, ii. 425-427; of $\sin^2 \frac{1}{3}\theta =$ $\frac{1}{3}(1-\cos\theta)$, ii. 429-431; of $\cos (\theta + \phi) = \cos \theta \cos \phi \sin \theta \sin \phi$, ii. 431-435; a method of interpolation, ii. 435-443; the table of sines, ii. 443-445; "Menelaus's Theorem " and lemmas, ii. 447-463; proof that tan $a: \tan \beta < a:\beta$, 503-505 (incl. n. a), ii. 11 n. b, ii. 389 and n. b; proof that $\sin \alpha : \sin \beta < \alpha : \beta$, ii. 439 n. a

Trisection of an angle: a "solid" problem, 353; solution by means of a verging, 353-357; direct solution by means of conics, 357-363; Pappus's collection of solutions, ii. 581 n. b

Unit, 67, 73, 89-91, ii. 469, ii. 515 Usener, 237 n. b

Valckenaer, 259 n. a Ver Eecke, Paul, ii. 19 n. a, ii. 285 n. a, ii. 513 n. a Vergings: Definition, 244 n. a; use by Hippocrates of Chios, 245; by Pappus, 355-357; by Archimedes, ii. 189 and n. c; Apollonius's treatise, ii. 345-347, ii. 337

Vieta's expression for $2/\pi$, 315 n. a

Vitruvius, ii. 3 n. a, ii. 251 n. a

Viviani's curve of double curvature, 349 n. c

Wescher, C., his Polioretique des Grecs, 267 n. b Wilamowitz - Moellendorf, U. v., 257 n. a

William of Moerbeke; his trans. of Archimedes' On Floating Bodies, ii. 242 n. a, ii. 245 n. b; De Speculis, ii. 503 n. a

Xenocrates, 75, 425 n. b

Zeno of Elea: life, 367 n. a; a disciple of Parmenides, ii. 367 n. a; four arguments on motion, 367-375 Zenodorus, ii. 387 n. b; on isoperimetric figures, ii.

387-397 Zero, 47 and n. a

Zeuthen: Die Lehre von den Kegelschnitten im Altertum, 493 n. b, ii. 265 n. a. ii. 281 n. a: Geschichte der Mathematik, 245 n. a; otherwise mentioned, 381 n. a, 505 n. a

Zodiac circle: division into 360 parts, ii. 395-397; signs of Zodiac, 223 n. c

The figures in parentheses give the page or pages in this edition where the passage is cited; in the case of vol. i. the reference to the volume is omitted.

The purpose of this index is to give one or more typical examples of the use of Greek mathematical terms occurring in these volumes. Non-mathematical words, and the non-mathematical uses of words, are ignored, except occusionally where they show derivation. Greek mathematical terminology may be further studied in the Index Graecitatis at the end of the third volume of Hultsch's edition of Pappus and in Heath's notes and essays in his editions of Euclid, Archimedes and Apollonius. References tovol, are by page alone, to col, it by volume and page. A few common abbreviations are used. Words should be sought under their principal part, but a few cross-references are given for the less obvious.

"Αγειν, to draw; εὐθεῖαν γραμμήν άγαγείν, to draw straight line, 442 (Eucl.); έὰν ἐπιψαύουσαι ἀχθῶσιν, if tangents be drawn. 64 (Archim.); παράλληλος $\eta \chi \theta \omega \eta AK$, let AK be parallel, ii. 312 drawn (Apollon.) άγεωμέτρητος, ον. ignorant of or unversed in geometry, 386 (Tzetzes) undivided. άδι πρετος, ov, indivisible, 366 (Aristot.) άδύνατος, ον, impossible, 394 (Plat.), ii. 566 (Papp.); ὅπερ ἐστὶν à., often without έστίν, which is impossible, a favourite conclusion to reasoning based on false premises, ii. 122 (Archim.); οί διὰ τοῦ ά, περαίνοντες,

ά. φιλοτεχιότατον, a vollection most skilfully framed, 480 (Papp.)
Αἰγυπτακός, ή, όν, Egyptian; αἰ Αἰ. καλούμεναι μέθοδοι ἐν πολλαπλασιασμοῖς, 16 (Schol. in Plat. Charm.) αἴρειν, to take away, subtract, ii. 506 (Heron) αἰτεῖν, to postulate, 442 (Eucl.), ii. 206 (Archim.)

those who argue per im-

possibile, 110 (Aristot.)

άθροισμα, ατος, τό, collection:

(Eucl.), Il. 206 (Archim.) αἴτημα, ατος, τό, postulate, 420 (Aristot.), 440 (Eucl.), ii. 366 (Procl.) ἀκύτητος, ον, that cannot be moved, immobile, fixed, 394 (Aristot.), ii. 246 (Archim.) ἀκολουθεῖν, to follow, ii. 414 (Ptol.)

ἀκόλουθος, ov. following, consequential, corresponding, ii. 580 (Papp.); as subst., ἀκόλουθον, τό, consequence, ii. 566 (Papp.)

ἀκολούθως, adv., consistently, consequentially. in458 (Eucl.). ii. 384 (Procl.)

άκουσματικός, ή, όν, eager to hear; as subst., d., δ, hearer, exoteric member of Pythagorean school, 3 n. d(Iambl.)

άκριβής, és, exact, accurate, precise, ii. 414 (Ptol.)

акроs, a, ov, at the farthest 270 end.extreme. ii. (Cleom.); \mathbf{of} extreme terms in a proportion, 122 (Nicom.); α. καὶ μέσος λόγος, extreme and mean ratio, 472 (Eucl.), ii. 416 (Ptol.)

ἄλλως, alternatively. 356

(Papp.)

άλογος, ov, irrational, 420 (Aristot.), 452 (Eucl.), 456 (Eucl.); δι' ἀλόγου, by irrational means, 388 (Plut.)

ἀμβλυγώνιος, $o\nu_{\bullet}$ obtuseangled; d. τρίγωνον, 440 (Eucl.); ά. κῶνος, ii. 278 (Eutoc.)

 $d\mu\beta\lambda \dot{v}_{S}$, $\epsilon \hat{u}_{S}$, \dot{v}_{S} , obtuse; \dot{d}_{S} . γωνία, often without γωνία, obtuse angle, 438 (Eucl.)

ἀμετάθετος, ov, unaltered, immutable; μονάδος ἀ. οὔσης, ii. 514 (Dioph.)

άμήχανος, ον, impracticable. 298 (Eutoc.)

ἄμφοισμα, ατος, τό, revolving figure, ii. 604 (Papp.)

αμφοιστικός, ή, όν, described bu revolution; ἀμφοιστικόν, τό, figure generated by revolution, ii. 604 (Papp.)

αναγράφειν, to describe, construct, 180 (Eucl.), ii. 68

(Archim.)

dvaκλâv, to bend back, incline, reflect (of light), ii. 496

(Damian.)

ἀνάλλημμα, ατος, τό, a representation of the sphere of the heavens on a plane, analemma; title of work by Diodorus, 300 (Papp.)

avaλογία, ή, proportion, 446 (Eucl.): κυρίως á. πρώτη, proportion par excellence and primary, i.e., geometric proportion, 125 n. a; συνεχής d., continued proportion, 262 (Eutoc.)

avaλογον, adv., proportionally, but nearly always used adjectivally.

(Eucl.), 446 (Eucl.)

ἀναλύειν, to solve by analysis, ii. 160 (Archim.); o avaλυόμενος τόπος, the Treasury of Analysis, often without τόπος, e.g., ὁ καλούμενος αναλυόμενος, ii, 596 (Papp.)

ανάλυσις, εως, ή, solution of a problem by analytical methods, analysis, ii. 596

(Papp.)

ἀναλυτικός, ή, όν, analytical, 158 (Procl.)

άναμέτρησις, εως, ή, πεακυτεment: Περί της d. της γης, title of work by Eratosthenes, ii. 272 (Heron)

aνáπαλιν, adv., in a recerse direction; transformation of a ratio known as invertendo, 448 (Eucl.)

ἀναποδεικτικώς, adv., independently of proof, ii. 370

(Procl.)

ἀναστρέφειν, to convert ratio according to the rule of Eucl. v. Def. 16; avaστρέψαντι, lit. to one who has converted, convertendo, 466 (Eucl.)

άναστροφή, ή, conversion of a ratio according to the rule of Eucl. v. Def. 16, 448

(Eucl.)

ἀνεπαίσθητος, ov, unperceived, imperceptible; hence, negligible, ii. 482 (Heron) άνισος, ον. unequal, (Ar-(Eucl.), ii. 50 chim.)

åνιστάναι, to set up, erect, ii.

78 (Archim.)

ἀντακολουθία, ή, reciprocity,

76 (Theol. Arith.)

άντικεῖσθαι, to be opposite, 114 (Nicom.); τομαὶ ἀντικείμεναι, opposite branches of a hyperbola, ii. 3?? (Apollon.)

άντιπάσχειν, to be reciprocally proportional, (Nicom.); ἀντιπεπονθότως, adv., reciprocally, ii. 208 (Archim.)

άντιστροφή, ή, conversion. converse, ii. 140 (Archim. ap. Eutoc.)

άξίωμα, ατος, τό, axiom, postulate, ii. 42 (Archim.)

άξων, ovos, ό, axis; of a cone, ii. 286 (Apollon.); of any plane curve, ii. 288 (Apollon.); of a conic section, 282 (Eutoc.); συζυγεῖς ἀ., conjugate axes, ii. 288 (Apollon.)

άόριστος, ov, without boundaries, undefined, $\pi \lambda \hat{\eta} \theta os$ μονάδων å., ii. 522

(Dioph.)

ἀπαγωγή, ή, reduction of one problem or theorem to another, 252 (Procl.)

ἀπαρτίζειν, to make even ; οί άπαρτίζοντες άριθμοί, fuctors, ii. 506 (Heron)

infinite $d\pi \epsilon \iota \rho a \chi \hat{\omega} s$, in an number of ways, ii. 572

(Papp.)

ἄπειρος, $o\nu$, infinite; subst., ἄπειρον, τό, the infinite, 424 (Aristot.); els $\check{a}\pi\epsilon\iota\rho o\nu$, to infinity, definitely, 440 (Eucl.); èπ' á., ii. 580 (Papp.)

ἀπεναντίον, adv. used adjectivally, opposite; aí à.

πλευραί, 444 (Eucl.)

 $d\pi \epsilon \chi \epsilon v$, to be distant, 470 (Eucl.), ii. 6 (Aristarch.) άπλανής, ές, motionless, fixed.

 2 (Archim.) aπλατής, ές, without breadth,

436 (Eucl.)

άπλόος, η, ον, contr. άπλοῦς, η, οῦν, simple; ά. γραμμή, 360 (Proel.)

άπλῶς, simply, absolutely, 124 (Aristot.); generally, ii. 132 (Archim.)

 \ddot{a} πλωσις, εως, $\dot{\eta}$, simplification, explanation; A. έπιφανείας σφαίρας, Explanation of the Surface of a Sphere, title of work by Ptolemy, ii. 408 (Suidas)

ἀπό, from; τὸ ἀπὸ τῆς διαμέτρου τετράνωνον. square on the diameter. $3\bar{3}2$ (Archim.); $\tau \dot{o}$ $d\pi \dot{o}$ ΓH (sc. $\tau \epsilon \tau \rho \dot{\alpha} \gamma \omega \nu \sigma \nu$), the square onΓH. 268 (Eutoc.)

 $d\pi \circ \delta \epsilon \iota \kappa \tau \iota \kappa \circ \varsigma$, $\dot{\eta}$, $\dot{\circ} v$, affording proof, demonstrative, 420 (Aristot.), 158 (Procl.)

άποδεικτικώς. adv., theoretically, 260 (Eutoc.) ἀπόδειξις, εως, ή, proof, demonstration, ii. 42 (Ar-

chim.), ii. 566 (Papp.) ἀποκαθιστάναι, to re-establish. restore; pass., to return to an original position, ii. 182 (Archim.)

 $\dot{a}\pi o \lambda a \mu \beta \dot{a} \nu \epsilon i \nu$, to cut off: $\dot{\eta}$ άπολαμβανομένη περιφέρεια, 440 (Eucl.)

άπορία, ή, difficulty, perplexity, 256 (Theon Smyr.)

ἀπόστημα, ατος, τό, distance, interval, ii. 6 (Aristarch.) άποτομή, ή, cutting off, section; Λόγου ἀποτομή, Χωρίου ἀποτομή, works bv Apollonius, ii. 598(Papp.) ; compound rational straight line equivalent to binomial surd with negative sign, apotome, 456 (Eucl.)

απτειν, to fasten to: mid.. ἄπτεσθαι, to be in contact. meet, 438 (Eucl.), ii. 106 (Archim.)

apa, therefore, used for the steps in a proof. 180

(Eucl.)

άρβηλος, ό, semicircular knife used by leather-workers, a geometrical figure used by Archimedes and Pappus. ii. 578 (Papp.)

άριθμεῖν, to number, reckon, enumerate, ii. 198 (Ar-

chim.), 90 (Luc.)

ἀριθμητικός, ή, όν, of or for reckoning or numbers: h άριθμητική (sc.τέγνη). arithmetic, 6 (Plat.), 420 (Aristot.); ή ἀριθμητική μέση (sc. $\epsilon \dot{\vartheta} \theta \epsilon \hat{\imath} a$), arithmetic mean, ii. 568 (Papp.): α. μεσότης, 110 (Iambl.)

ἀριθμητός, ή, όν, that can be counted. numbered. 16

(Plat.)

άριθμός, ό, number, 6 (Plat.), 66 (Eucl.); πρώτος ά., prime number, 68 (Eucl.); πρώτοι, δεύτεροι, τρίτοι, τέταρτοι, πέμπτοι ά., numbers of the first, second, third, fourth, fifth order, ii. 198-199 (Archim.); μηλίτης d., problem about a number of sheep, 16 (Schol. in Plat. Charm.); φιαλίτης a., problem about a number of bowls (ibid.)

ἀριθμοστόν, τό, fraction whose denominator is unknown [1], ii. 522 (Dioph.)

άρμόζειν, to fit together, ii.

494 (Heron)

άρμονία, ή, musical scale. octave, music, harmony, 404 (Plat.); used to denote a square and a rectangle, 398 (Plat.)

άρμονικός, ή, όν, skilled in music, musical; ή άρμονική (sc. ἐπιστήμη), mathematical theory of music, harmonic; ή άρμονική μέση, harmonicmean. (Iambl.)

άρτιάκις, adv., an even number of times; ά. ἄρτιος άριθμός, even-times even number, 66 (Eucl.)

άρτιόπλευρος, ov, having an even number of sides; πολύγωνον ά., ii. 88 (Archim.)

άρτιος, a, ov, complete, perfect: ἄ. ἀριθμός, even num-

ber, 66 (Eucl.)

dρχή, ή, beginning or principle of a proof or science, 418 (Aristot.); beginning of the motion of a point describing a curve; do. τη̂s ξλικοs, origin of the spiral, ii. 182

άρχικός, ή, όν, principal, fundamental; å. πτωμα, principal property of a curve, ii. 282 (Apollon.), 338 (Papp.)

άρχικώτατος, ον, sovereign,

fundamental; à. pila, 90 (Nicom.)

άρχιτεκτονικός, ή, όν, of or for an architect; ή άρχιτεκτονική (sc. τέχνη), architecture, ii. 616 (Papp.)

aστρολογία, ή, astronomy, 388 (Aristox.)

άστρολόγος, ό,

astronomer. 378 (Suidas) ἀστρονομία, ή, astronomy, 14

(Plat.)

ἀσύμμετρος, ov. incommensurable, irrational, 110 (Aristot.), 452 (Eucl.), ii. 214 (Archim.)

ἀσύμπτωτος, ov, not falling in, non-secant, asymptotic, ii. (Procl.); å. γραμμή), ή, asymptote, ii. 282 (Apollon.)

ἀσύνθετος, ον, incomposite; å. γραμμή, 360 ii.

(Procl.)

ἄτακτος, ov, unordered : Π ερὶ άτ. ἀλόγων, title of work by Apollonius, ii 350 (Procl.)

ἀμφοιστικά, figures generated by an incomplete revolution. ii. 604 (Papp.)

ἄτομος, ον, indivisible; ἄτομοι γραμμαί, 424 (Aristot.)

άτοπος, ov, out of place, absurd; ὅπερ ἄτοπον, which is absurd, a favourite conclusion to a piece of reasoning based on a false premise, e.g. ii. 114 (Archim.)

οθέάνειν, to increase, to multiply; τρίς αὐξηθείς, 398 (Plat.)

aὕξη, ἡ, increase, dimension, 10 (Plat.)

αύξησις, εως, ή, increase, multiplication, 398 (Plat.) αὐτόματος, η, ον, self-acting; Αὐτόματα, τά, title work by Heron, ii. 616 (Papp.)

ἀφαιρεῖν, to cut off, take away,

ii. 64 (Archim.)

subtract, 414 (Eucl.) $\dot{a}\phi\dot{\eta}$, $\dot{\eta}$, point of concourse of straight lines; point of contact of circles or of a straight line and a circle,

'Aχιλλεύς, έως, ό, Achilles, the first of Zeno's four arguments on motion.

(Aristot.)

Βάρος, ους, Ιοη. εος, τό, weight, esp. in a lever, ii. 206 (Archim.), or system of pulleys, ii. 490 (Heron) ; τὸ κέντρον τοῦ βάρεος, centre of gravity, ii. 208 (Archim.)

βαρουλκός (εc. μηχανή), lifting-screw invented by Archimedes, title of work by Heron, ii. 489 n. a

 $\beta \dot{a}\sigma is$, $\epsilon \omega s$, $\dot{\eta}$, base; of a geometrical figure; of a triangle, 318 (Archim.); of a cube, 222 (Plat.); of a cylinder, ii. 42 (Archim.); of a cone, ii. 304 (Apollon.); of a segment of a sphere, ii. 40 (Ārchim.)

 $\Gamma \epsilon \omega \delta \alpha i \sigma (a, \dot{\eta}, land dividing,$ mensuration, geodesy, 18 (Anatolius)

γεωμετρείν, to measure, to practise geometry; $d\epsilon i \gamma$. θεόν, 386 (Plat.); γεωμετρουμένη έπιφάνεια, geometric surface. (Eutoc.). γεωμετρουμένη ἀπόδειξις, geometric proof, ii. 228 (Archim.)

landγεωμέτρης, oυ, ò. measurer, geometer, 258

(Eutoc.)

γεωμετρία, ή, land measurement, 256 geometry. (Theon Smyr.), 144 (Procl.)

γεωμετρικός, ή, όν, pertaining to geometry, geometrical, 590 (Papp.), 298 (Eutoc.)

γεωμετρικώς, adv., geometrically, if. 222 (Archim.)

γίνεσθαι, to be brought about; γεγονέτω, let it be done, a formula used to open a piece of analysis; curves, to be generated, ii. 468 (Heron); to be brought about by multiplication, i.e., the result (of the multiplication) is, ii. 180 (Heron); τὸ γενόμενον, τὰ γενόμενα, the product, ii. 482 (Heron)

γλωσσόκομον, τό, chest, ii. 490

(Papp.)

γνωμονικός, ή, όν, of or concerning sun-dials, ii. 616 (Papp.)

square; pointer of a sundial, ii. 268 (Cleom.); geometrical figure known as gnomon, number added to a figured number to get the next number, 98 (Iambl.)

(ramon)

γραμμή, ή, line, curve, 436 (Eucl.); εὐθεῖα γ. (often without γ.), straight line, 438 (Eucl.); ἐκ τῶν γραμμῶν, rigorous proof by geometrical arguments, ii. 412 (Ptol.)

γραμμικός, ή, όν, linear, 348

(Papp.)

γράφειν, to describe, 449 (Eucl.), ii. 582 (Papp.), 298 (Eutoc.); to prove, 380 (Plat.), 260 (Eutoc.)

γραφή, ή, description, account, 260 (Eutoc.); writing, treatise, 260 (Eutoc.)
γωνία, ή, angle; ἐπίπεδος γ., plane angle (presumably including angles formed by curves), 438 (Eucl.); εὐθύγραμμος γ., rectilineal angle (formed by straight lines), 438 (Eucl.); ὀρθή, ἀμβλεῖα, ὀξεῖα γ., right, obtuse, acute angle.

Δεικνύναι, to prove; δέδεικται γάρ τοῦτο, for this has been proved, ii. 920 (Archim.); δεικτέον ὅτι. it is required to prove that, ii. 168 (Archim.)

440 (Eucl.)

δεῖν, to be necessary, to be required; δέον έστω, let it

be required; ὅπερ ἔδει δείξαι, quod erat demonstrandum, which was to be proved, the customary ending to a theorem, 184 (Eucl.); ὅπερ: ~= ὅπερ ἔδει δείξαι. ii. 610 (Papp.)

δεκάγωνον, τό, a regular plane figure with ten angles, decagon, ii. 196 (Archim.) δῆλος, η, ον, also os, ον, manifest, clear, obvious; δτι

fest, clear, obvious; δτι μὲν οὖν αὔτα συμπίπτει, δῆλον, ii. 192 (Archim.) διάνεω, to draw through, 190

διάγειν, to draw through, 190 (Eucl.), 290 (Eutoc.) διάγραμμα, ατος, τό, figure,

diagram, 428 (Aristot.) διαιρέν, to divide, cut, ii. 286 (Apollon.): διηρημένος, ov. dicided: δ. ἀναλογία, discrete proportion. 262 (Eutoc.); διελόντι, lit. to one having divided, dirimendo (or, less correctly, dividendo), indicating the transformation of the ratio a:b into a-b:b according to Eucl. v. 15.

διαίρεσις, εως, ή, division, separation, 368 (Aristot.); δ. λόγου, transformation of a ratio dividendo, 448 (Eucl.)

ii. 130 (Archim.)

διαμένειν, to remain, to remain stationary, 258 (Eutoc.)

διάμετρος, ov, diagonal, diametrical; as subst., δ. (sc. γραμμή), ή, diagonal; of a parallelogram, ii. 218

(Archim.); diameter of a circle, 438 (Eucl.); of a sphere, 466 (Eucl.); principal axis of a conic section in Archim., ii. 148 (Archim.); diameter of any plane curve in Apollon., ii. 286 (Apollon.); πλαγία δ., transverse diameter, ii. 286 (Apollon.); συζυγεῖς δ., conjugate diameters, ii. 288 (Apollon.)

διάστασις, εως, ή, dimension, 412 (Simpl.)

διαστέλλειν, to separate, ii. 502 (Heron)

διάστημα, ατος, τό, interval; radius of a circle, ii. 192 (Archim.), 442 (Eucl.); interval or distance of a conchoid, 300 (Papp.); in a proportion, the ratio between terms, τὸ τῶν μειζόνων ὅρων δ., 112 (Archytas ap. Porph.); dimension, 88 (Nicom.) δυσλος ἡ difference 114

διαφορά, ή, difference, 114 (Nicom.)

διδόναι, to give; aor. part., δοθείς, είσα, έν, given, ii. 598 (Papp.); Δεδομένα, τά, Data, title of work by Euclid, ii. 588 (Papp.); θέσει καὶ μεγέθει δεδόσθαι, to be given in position and magnitude, 478 (Eucl.)

διελόντι, ν. διαιρείν

διεχής, ές, discontinuous; σπείρα δ., open spire, ii. 364 (Procl.)

διορίζειν, to determine, ii. 566 (Papp.); Διωρισμένη

τομή, Determinate Section, title of work by Apollonius, ii. 598 (Papp.)

διορισμός, δ, statement of the limits of possibility of a solution of a problem, diorismos, 150 (Procl.)

διπλασιάζειν, to double, 258 (Eutoc.)

διπλασιασμός, δ, doubling, duplication; κύβου δ., 258 (Eutoc.)

διπλάσιος, α, ον, double, 302 (Papp.); δ. λόγος, duplicate ratio, 446 (Eucl.)

διπλασίων, ον, later form for διπλάσιος, double, 326 (Archim.)

διπλόος, η, ον, contr. διπλοῦς, η, οῦν, twofold, double, 326 (Archim.); δ. ἰσότης, double equation, ii. 528 (Dioph.)

δίχα, adv., in two (equal)
parts, 66 (Eucl.): δ.
τέμνειν, to bisect, 440
(Eucl.)

διχοτομία, ή, dividing in two: point of bisection, ii. 216 (Archim.); Dichotomy, first of Zeno's arguments on motion, 368 (Aristot.)

διχοτόμος, ον, cut in two, halved, ii. 4 (Aristarch.)

δύναμις, εως, ή, power, force, ii. 488 (Heron), ii. 616 (Papp.); ai πέντε δ., the five mechanical powers (wheel and axle, lever, pulley, wedge, screw), ii. 492 (Heron); power in

the algebraic sense, esp. square: δυνάμει, in power, i.e., squared, 322 (Archim.); δυνάμει σύμμετρος, commensurable in square, 450 (Eucl.); δυνάμει ἀσύμμετρος, incommensurable in square (ibid.)

δυναμοδύναμις, εως, ή, fourth

quantity (Dioph.)

δυναμοδυναμοστόν, τό, the fraction $\frac{1}{x^4}$, ii. 522 (Dioph.)

 $[x^4]$.

ii.

δυναμόκυβος, δ, square multiplied by a cube, fifth power of the unknown quantity $[x^5]$, ii. 522 (Dioph.)

δυναμοκυβοστόν, τό, the fraction $\frac{1}{c_0}$, ii. 522 (Dioph.)

δυναμοστόν, τό, the fraction $\frac{1}{r^2}$, ii. 522 (Dioph.)

δύνασθαι, to be able, to be equivalent to: δύνασθαί τι. to be equivalent squared to a number or area, ii. 96 (Archim.); ή δυναμένη (sc. εὐθεῖα), side of a square, 452 (Eucl.); αὐξήσεις δυνάμεναι, (Plat.): παρ' ην δύνανται αί καταγόμεναι τεταγμένως έπὶ τὴν ZH διάμετρον, the parameter of the ordinates to the diameter ZH, ii, 308 (Apollon.)

δυναστεύειν, to be powerful; pass., to be concerned with

powers of numbers; αὐξήσεις δυναστευόμεναι, 398 (Plat.)

δυνατός, ή, όν, possible, ii. 566 (Papp.)

δυοκαιενενηκοντάεδρον, τό, solid with ninety-two faces, ii. 196 (Archim.)

δυοκαιεξηκοντάεδρον, τό, solid with sixty-two faces, ii. 196 (Archim.)

δυοκαιτριακοντάεδρον, τό, solid with thirty-two faces, ii. 196 (Archim.)

δωδεκάεδρος, ον, with twelve faces: as subst., δωδεκάεδρον, τό, hody with twelve faces, dodecahedron, 472 (Eucl.), 216 (Λετ.)

'Εβδομηκοστόμονος, ον, seventy-first; τὸ έ., seventy-first part, 320 (Archim.)

έγγράφειν, to inscribe, 470 (Eucl.), ii. 46 (Archim.)

έγκύκλιος, ον. also α, ον, circular, ii. 618 (Papp.)

clos, ovs, Ion. cos, τό, shape or form of a figured number, 94 (Aristot.); figure giving the property of a conic section, viz.., the rectangle contained by the diameter and the parameter, ii. 317 n. a, 358 (Papp.), 282 (Eutoc.); term in an equation, ii. 524 (Dioph.): species—of number, ii. 522 (Dioph.), of angles 390 (Plat.)

elkoσάεδρος, ον, having twenty faces: εlκοσάεδρον, τό, body with twenty faces, icosahedron, 216 (Aët.)

elκοσαπλάσιος, ον, twentyfold, ii. 6 (Aristarch.)

έκατοντάς, άδος, ή, the number *one hundred*, ii. 198 (Archim.)

čκβάλλειν, to produce (a straight line), 442 (Eucl.), ii. 8 (Aristarch.), 352 (Papp.)

έκκαιεικοσάεδρον, τό, solid with twenty-six faces, ii. 196 (Archim.)

έκκεισθαι, used as pass. of ἐκτιθέναι, to be set out, be taken, ii. 96 (Archim.),

298 (Papp.)

є́ккро́́и, to take away, eliminate, ii. 612 (Papp.)

ἐκπέτασμα, ατος, τό, that which is spread out, unfolded: Ἐκπετάσματα, title of work by Democritus dealing with projection of armillary sphere on a plane, 229 n. a

ĕκπρισμα, ατος, τό, section sawn out of a cylinder, prismatic section, ii. 470 (Heron)

έκτιθέναι, to set out, ii. 568

(Papp.)

έκτός, adv.. without, outside; as prep., ἐ. τοῦ κύκλου, 314 (Alex. Aphr.); adv. used adjectivally, ἡ ἐ. (sc. εὐθεῖα), external straight line, 314 (Simpl.); ἡ ἐ. γωνία τοῦ τριγώνου, the external

angle of the triangle, ii. 310 (Apollon.)

έλάσσων, ov, smaller, less, 320 (Archim.); ήτοι μείζων ἐστὶν ἢ ἐ., ii. 112 (Archim.); ἐ. ὀρθῆς, less than a right angle, 438 (Eucl.); ἢ ἐ. (sc. εὐθεῖα), minor in Euclid's classification of straight lines, 458 (Eucl.);

έλάχιστος, η, ον, smallest, least, ii. 44 (Archim.)

ξλιξ, ξλικος, ή, spiral, helix,
 ii. 182 (Archim.); spiral
 on a sphere, ii. 580
 (Papp.)

ἔλλειμμα, ατος, τό, defect, deficiency, 206 (Eucl.)

čλλείπειν, to fall short, be deficient, 394 (Plat.), 188 (Procl.)

čλλευψις, εως, ή, falling short, deficiency, 186 (Procl.); the conic section ellipse, so called because the square on the ordinate is equal to a rectangle whose height is equal to the abscissa applied to the parameter as base but falling short (ἐλλεἴπου), ii. 316 (Apollon.), 188 (Procl.)

έμβαδόν, τό, area, ii. 470

(Heron)

ἐμβάλλεω, to throw in, insert,
 ii. 574 (Papp.); multiply,

ii. 534 (Dioph.)

έμπίπτεω, to fall on, to meet, to cut, 442 (Eucl.), ii. 58 (Archim.)

έμπλέκειν, to plait or weave in; σπείρα έμπεπλεγμένη,

interlaced spire, ii. 364 (Procl.) adv.. often used εναλλάξ, adjectivally. transformation of a ratio according to the rule of Eucl. v. Def. 12, permutando, 418 (Eucl.), (Archim.); ii. 144 é. γωνίαι, alternate angles έναντίος, a, ov, opposite; κατ' ¿., ii. 216 (Archim.) εναρμόζειν, to fit in, to insert, 284 (Eutoc.) $\check{\epsilon}$ ντασις, $\epsilon\omega$ ς, $\check{\eta}$, inscription, 396 (Plat.) έντελής, ές, perfect. complete; τρίγωνον έ., 90 (Procl.) έντός, adv. used adjectivally, within, inside, interior; aί ε. γωνίαι, 442 (Eucl.) ένυπάρχειν, to exist in; είδη ένυπάργοντα, τά, positive terms, ii. 524 (Dioph.) $\dot{\epsilon}$ ξαγωνικός, $\dot{\eta}$, $\dot{\epsilon}$ ν, hexagonal; έ. ἀριθμός. 96 (Nicom.) έξάγωνος, ον, as subst. έξάγω-

(Eucl.) έξηκοστός, ή, όν, sixtieth; in astron., πρῶτον έξηκοστόν, τό, first sixtieth, minute, δεύτερον έ., second sixtieth, second, 50 (Theon Alex.)

hexagon,

νον. τό.

έξη̂s, adv., in order, successively, ii. 566 (Papp.) ἐπαφή, ή, touching, tangency,

raugh, η, touching, tangency, contact, 314 (Simpl.); 'Επαφαί, On Tangencies, title of a book by Apollonius, ii, 336 (Papp.)

έπεσθαι, to be or come after, follow; τὸ έπόμενον, con-

sequence, ii. 566 (Papp.); τὰ ἐπόμενα, rearward elements, ii. 184 (Apollon.); in theory of proportion, τὰ ἐπόμενα, following terms, consequents, 448 (Eucl.)

έπί, prep. with acc., upon, on to, on, εὐθεῖα ἐπ' εὐθεῖαν σταθεῖσα, 438 (Eucl.)

έπιζευγνύναι, to join up, ii. 608 (Papp.); ai ἐπιζευχθεῖσαι εὐθεῖαι, connecting lines, 272 (Eutoc.)

ἐπιλογίζεσθαι, to reckon, calculate, 60 (Theon Alex.)

èπιλογισμός, δ, reckoning, calculation, ii. 412 (Ptol.)

ἐπίπεδος, ον, plane; ἐ. ἐπιφάνεια, 438 (Eucl.); ἐ. γωνία, 438 (Eucl.); ἐ. σχῆμα, 438 (Eucl.); ἐ. ἀριθμός, 70 (Eucl.); ἐ. πρόβλημα, 348 (Papp.)

έπιπέδως, adv., plane-wise, 88 (Nicom.)

ἐπιπλατής, ές, flat, broad; σφαιροείδὲς ἐ., ii. 164 (Archim.)

ἐπίταγμα, ατος, τό, injunction: condition, ii. 50 (Archim.), ii. 526 (Dioph.); ποιεῖν τὸ ἐ., to satisfy the condition; subdivision of a problem, ii. 340 (Papp.)

έπίτριτος, ov, containing an integer and one-third, in the ratio 4:3, ii. 222

(Archim.) - επιφάνεια, ή, surface, 438 (Eucl.); κωνική ε., conical

surface (double cone), ii. 286 (Apollon.)

embaύειν, to touch, ii, 190 (Archim.); ή ἐπιψαύουσα (sc. εὐθεῖα), tangent, ii. 64 (Archim.)

έτερομήκης, ες, with unequal sides, oblong, 440 (Eucl.)

εὐθύγραμμος, ον, rectilinear; ευ. νωνία, 438 (Eucl.); ευ. σχημα, 440 (Eucl.): subst.. εὐθύγραμμον. τó. rectilineal figure, 318 (Archim.)

εὐθύς, εîa, ύ, straight; εὐ. γραμμή, straight line, 438 (Eucl.); εὐθεῖα (sc. γραμμή), ή, straight line, ii. 44 (Archim.); chord of a circle, ii. 412 (Ptol.); distance (first, second, etc.) in a spiral, ii. 182 (Archim.); κατ' εὐθείας. along 580 straight line. ii. (Papp.)

ευπαραχώρητος, ov. readily admissible, easily obvious; εὐ. λήμματα, ii. 230 (Ar-

chim.)

ευρεσις, εως, ή, discovery, solution, ii. 518 (Dioph.), 260 (Eutoc.)

εύρημα, ατος, τό, discovery,

380 (Schol. in Eucl.) ευρίσκειν, to find, discover, solve, ii. 526 (Dioph.), 340 (Papp.), 262(Eutoc.): οπερ έδει εύρειν, which was be found, 283 (Eutoc.)

εύχερής, ές, easy to solve, ii.

526 (Dioph.)

ἐφάπτεσθαι, to touch, ii. 224 (Archim.); έφαπτομένη, ή (sc. $\epsilon \vec{v}\theta \epsilon \hat{\imath}a$), tangent, 322 (Archim.)

έφαρμογή, ή, coincidence of geometrical elements, 340

(Papp.)

έφαρμόζειν, to fit exactly, coincide with, 444 (Eucl.), 208 (Archim.), 298 pass. έφαρμό-(Papp.); ζεσθαι, to be applied to, ii. 208 (Archim.)

έφεξης, adv., in order, one after the other, successively, 312 (Them.); used adjectivally, as ai é. ywvíai, the adjacent angles, 483

(Eucl.)

έφιστάναι, to set up, erect; perf., έφεστηκέναι, intr., stand, and perf. part. act., έφεστηκώς, υία, ός, standing, 438 (Eucl.)

 $\epsilon \phi$ οδος, $\dot{\eta}$, method, ii. 596 (Papp.): title of work by

Archimedes

έχειν, to have: λόγον έ., to have a proportion or ratio. ii. 14 (Aristarch.) : γένεσιν ¿., to be generated (of a curve), 348 (Papp.)

εωs, as far as, to, ii. 290

(Apollon.)

Zητεῖν, to seek, investigate, ii. 222 (Archim.); ζητούμενον, τό, the thing sought, 158 (Procl.). ii. (Papp.)

ζήτησις, εως, ή, inquiry, investigation, 152 (Procl.)

ζύγιου, τό = ζυγόν, τό, ii. 234 (Archim.)

ζυγόν, τό, beam of a balance, balance, ii. 234 (Archim.) ζώδιον, τό, dim. of ζώον, lit. small figure painted or carved; hence sign of the Zodiae; ὁ τών Ζ. κύκλος, Zodiae circle, ii. 394 (Hypsicles)

'Πγεῖσθαι, to lead: ἡγούμενα, τά, leading terms in a proportion, 448 (Eucl.)

ήμικύκλιοs, ον, semicircular; as subst., ήμικύκλιον, τό, semicircle, 440 (Eucl.), ii. 568 (Papp.)

ήμικύλινδρος, ό, half-cylinder, 260 (Eutoc.): dim. ήμικυλίνδριον, τό, 286 (Eutoc.)

ήμιόλιος, a, ov, containing one and a half, half as much or as large again, one-and-a-half times, ii. 42 (Archim.) ημισυς, εια, v, half, ii. 10 (Aristarch.): as subst., ημισυ, τό, 320 (Archim.)

Θέσις, εως, ή, setting, position, 268 (Eutoc.): θέσει δεδόσθαι, to be given in position, 478 (Eucl.)

θεωρείν, to look into, investigate, ii. 222 (Archim.)

θεώρημα, ατος, τό, theorem, 228 (Archim.), ii. 566 (Papp.), 150 (Procl.), ii. 366 (Procl.)

θεωρητικός, ή, όν, able to perceive, contemplative, speculative, theoretical: applied to species of analysis, ii. 598 (Papp.)

θεωρία, ή, inquiry, theoretical investigation, theory, ii. 222 (Archim.), ii. 568 (Papp.)

θυρεός, ό, shield, 490 (Eucl.): ἡ (sc. γραμμή) τοῦ θ., ellipse, ii. 360 (Procl.)

'Ioάκις, adv., the same number of times, as many times: τὰ ὶ. πολλαπλάσια, equimultiples, 446 (Eucl.)

lσοβαρής, és, equal in weight, ii. 250 (Archim.)

ївоукоs, ov, equal in bulk. equal in volume, ii. 250 (Archim.)

lσογώνιος, ον, equiangular, ii. 608 (Papp.)

lσομήκης, ες. equal in length. 398 (Plat.)

looπερίμετρος, ov, of equal perimeter, ii. 386 (Theon Alex.)

lσόπλευρος, ον, having all its sides equal, equilateral; ι, τρίγωνον, 440 (Eucl.), ι. τετράγωνον, 440 (Eucl.), ι. πολύγωνον, ii. 54 (Archim.)

iσοπληθής, és, equal in number, 454 (Eucl.)

lσορροπεῖν, to be equally balanced, be in equilibrium, balance, ii. 206 (Archim.)

¹Ισορροπικά, τά, title of work on equilibrium by Archimedes, ii. 226 (Archim.)

lσόρροπος, ov, in equilibrium, ii. 226 (Archim.)

ἴσος, η, ον, equal, 268 (Eutoc.); ἐξ ἴσον, evenly,

438 (Eucl.); δι' ἴσου, ex aequali, transformation of a ratio according to the rule of Eucl. v. Def. 17. 448 (Eucl.)

 $l\sigma o\sigma \kappa \epsilon \lambda \dot{\eta} s$, $\dot{\epsilon} s$, with equal legs, having two sides equal, isosceles: i. τρίγωνον, 440 (Eucl.); ί. κῶνος, ii. 58 (Archim.)

iσοταχέως, uniformly, ii. 182 (Archim.)

ισότης, ητος, ή, equality, equation, ii. 526 (Dioph.) ίστάναι, to set up; εὐθεῖα έπ' εὐθεῖαν σταθεῖσα, 438 (Eucl.)

ίσωσις, εως, ή, making equal. equation, ii. 526 (Dioph.)

Κάθετος, ov, let down, perpendicular ; ή κ. (sc. γραμμή), perpendicular, 438 (Eucl.), ii. 580 (Papp.)

καθολικός, ή, όν, general; κ. μέθοδος, ii. 470 (Heron)

καθολικώς, generally; generολικώτερον, more ally, ii. 572 (Papp.)

καθόλου, adv., on the whole, in general: τὰ κ. καλούμενα θεωρήματα, 152 (Procl.)

καμπύλος, η, ον, curved; κ. γραμμαί, ii. 42 (Archim.); 260 (Eutoc.)

κανόνιον, τό, table, ii. 441 (Ptol.)

κανονικός, ή, όν, of or belonging to a rule; ή κανονική (sc. $\tau \dot{\epsilon} \chi v \eta$), the mathematical theory of music, theory of musical intervals,

canonic, 18 (Anatolius); κ. ἔκθεσις, display in the form of a table, ii. 412 (Ptol.)

κανών, όνος, ό, straight rod, bar, 308 (Aristoph.), 264 (Eutoc.); rule, standard, table, ii. 408 (Suidas)

κατάγειν, to draw down or out, ii. 600 (Papp.)

καταγραφή, ή, construction, 188 (Procl.); drawing. figure, ii. 158 (Eutoc.), ii. 444 (Ptol.), ii. 610 (Papp.)

καταλαμβάνειν, to overtake, 368 (Aristot.)

καταλείπειν, to leave, 454 (Eucl.), ii. 218 (Archim.), ii. 524 (Dioph.); τὰ κατα- $\lambda \epsilon \iota \pi \delta \mu \epsilon \nu a$, the remainders, 444 (Eucl.)

καταμετρείν, to measure, i.e., to be contained in an integral number of times, 444 (Eucl.)

κατασκευάζειν, to construct, (Eutoc.). 264ii. 566 (Papp.)

κατασκευή, ή, construction, ii. 500 (Heron)

ò, placing καταστερισμός, among the stars; Kataστερισμοί, οί, title of work wrongly attributed to Eratosthenes, ii. 262 (Suidas)

κατατομή, ή, cutting, section; K. κανόνος, title of work by Cleonides, 157 n. c

κατοπτρικός, ή, όν, of or in a mirror; Κατοπτρικά, τά, title of work ascribed to Euclid, 156 (Procl.)

κάτοπτρον, τό, mirror, ii. 498 (Heron)

κείσθαι, to lie, ii. 268 (Cleom.); of points on a straight line, 438 (Eucl.); as pass. of τιθέναι, to be placed or made; of an angle, 326 (Archim.); όμοίως κ., to be similarly situated, ii. 208 (Archim.)

κεντροβαρικός, ή, όν, of or pertaining to a centre of gravity; κ. σημεΐα, ii. 604

(Papp.)

κέντρον, τό, centre; of a circle, 438 (Eucl.), ii. 8 (Aristarch.), ii. 572 (Papp.); of a semicircle, 440 (Eucl.); ή (sc. γραμμή οτ εὐθεῖα) ἐκ τοῦ κ., radius of a circle, ii. 40 (Archim.); κ. τοῦ βάρεος, centre of gravity, ii. 208 (Archim.) κινεῖν, to move, 264 (Eutoc.) κίνησις, εως, ή, motion, 264

κισσοειδής, ές, Att. κιττοειδής, ές, like ivy; κ. γραμμή,

cissoid, 276 n. a

(Eutoc.)

κλάν, to bend, to inflect, 420 (Aristot.), 358 (Papp.): κλώμενα εὐθεῖαι, inclined straight lines, ii. 496 (Damian.)

κλίνειν, to make to lean; pass., to incline, ii. 252

(Archim.)

κλίσις, εως, ή, inclination; τῶν γραμμῶν κ., 438 (Eucl.)

κογχοειδής, ές, resembling a mussel; κ. γραμμαί (often

without y.), conchoidal curves, conchoids, 296 (Eutoc.)

κοίλος, η, ον, concave; ἐπὶ τὰ αὐτὰ κ., concave in the same direction, ii. 42 (Archim.), 338 (Papp.)

κοινός, ή, όν, common, 419 (Aristot.); κ. πλευρά, ii. 500 (Heron); κ. ἔννοιαι, 444 (Eucl.); κ. τομή, ii. 290 (Apollon.); τὸ κοινόν, common element, 306 (Papp.)

κορυφή, ή, vertex: of a cone, ii. 286 (Apollon.): of a plane curve, ii. 286 (Apollon.); of a segment of a sphere, ii. 40 (Archim.)

κοχλίας, ου, ό, snail with spiral shell; hence anything twisted spirally; screw, ii. 496 (Heron); screw of Archimedes, ii. 31 (Diod. Sic.): Περὶ τοῦ κ., work by Apollonius, ii. 350 (Procl.)

κοχλιοειδής, ές, of or pertaining to a shell fish; ή κ. (sc. γραμμή), cochloid, 334 (Simpl.); also κοχλοειδής, ές, as ή κ. γραμμή, 302 (Papp.); probably anterior to ή κογχοειδής γραμμή with same meaning

κρίκος, δ, ring; τετράγωνοι κ... prismatic sections of cylinders, ii. 470 (Heron)

κυβίζειν, to make into a cube, cube, raise to the third power, ii. 501 (Heron)

κυβικός, ή, όν, of or for a cube, cubic, 222 (Plat.)

κυβόκυβος, δ, cube multiplied by a cube, sixth power of the unknown quantity [x⁶], ii. 522 (Dioph.)

κυβοκυβοστόν, τό, the fraction $\frac{1}{r^6}$, ii. 522 (Dioph.)

κύβος, δ, cube, 258 (Eutoc.); cubic number, ii. 518 (Dioph.); third power of unknown, ii. 522 (Dioph.) κυβοστόν, τό, the fraction

 $\frac{1}{r^3}$, ii. 522 (Dioph.)

κυκλικός, ή, όν, circular, ii.

360 (Procl.)

κύκλος, δ, circle, 392 (Plat.), 438 (Eucl.); μέγιστος κ., great circle (of a sphere), ii. 8 (Aristarch.), ii. 42 (Archim.)

κυλινδρικός, ή, όν, cylindri-

cal, 286 (Eutoc.) κύλινδρος, ου, δ, cylinder, ii.

42 (Archim.)
κυρίως, adv., in a special
sense; κ. ἀναλογία, proportion par excellence, i.e.,
the geometric proportion,
125 n. a

κωνικός, ή, όν, conical, conic; κ. ἐπιφάνεια, conical surface (double cone), ii. 286

(Apollon.)

κωνοειδής, ές, conical; as subst. κωνοειδές, τό, conoid; όρθογώνιον κ., right-angled conoid, i.e., paraboloid of revolution, ii. 164; άμβλυγώνιον κ., obtuse-angled

conoid, i.e., hyperboloid of revolution, ii. 164

κῶνος, ου, δ, cone, ii. 286 (Apollon.)

κωνοτομείν, to cut the cone, 226 (Eratos. ap. Eutoc.)

Ααμβάνειν, to take, ii. 112 (Archim.); εἰλήφθω τὰ κέντρα, let the centres be taken, ii. 388 (Theon Alex.); λ. τὰς μέσας, to take the means, 294 (Eutoc.); to receive, postulate, ii. 44 (Archim.)

λέγειν, to choose, ii. 166 (Archim.)

λείπειν, to leave, ii. 62 (Archim.); λείποντα εἴδη, τά, negative terms, ii. 534 (Dioph.)

λείψις, εως, ή, negative term, minus, ii. 524 (Dioph.)

λήμμα, ατος, τό, auxiliary theorem assumed in proving the main theorem, lemma, ii. 608 (Papp.)

λημμάτιον, τό, dim. of $λ \hat{\eta} μμα$, lemma

ληψις, εως, η, taking hold, solution, 260 (Eutoc.)

λογικός, ή, όν, endowed with reason, theoretical, ii. 614

(Papp.)

λογιστικός, ή, όν, skilled or practised in reasoning or calculating; ή λογιστική (sc. τέχνη), the art of manipulating numbers, practical arithmetic, logistic, 17 (Schol. ad Plat. Charm.)

λόγος, ό, ratio, 444 (Eucl.); Λόγου ἀποτομή, Cutting-off of a Ratio, title of work by Apollonius, ii. 598 (Papp.); λ. συνημμένος, compound ratio, ii. 602 (Papp.); λ. μοναχός, singular ratio, ii. 606 (Papp.); ἄκρος καὶ μέσος λ., extreme and mean ratio, 472 (Eucl.), ii. 416 (Ptol.)

λοιπός, ή, όν, remaining, ii. 600 (Papp.); as subst., λοιπόν, τό, the remainder, ii. 506 (Papp.), 270 (Eutoc.)

λοξός, ή, όν, oblique, inclined; κατὰ λ. κύκλου, ii. 4 (Plut.) λύσις, εως, ή, solution, ii. 596 (Papp.)

Mayyaνάριος, ό, mechanical engineer, maker of mechanical powers, ii. 616 (Papp.) μάγγανον, τό, block of a pulley, ii. 616 n. a (Heron)

1. 010 ii. a (Heroin) μάθημα, τό, study, 8 (Plat.), 4 (Archytas); μαθήματα, τά, mathematics; τὰ δὲ καλούμενα ίδίως μ., 2 (Anatolius); 148 (Procl.), ii. 42 (Archim.), ii. 566 (Papp.)

μαθηματικός, ή, όν, mathematical; μαθηματικός, ό, mathematician, ii. 2 (Act.), ii. 61 (Papp.); ή μαθηματική (sc. ἐπιστήμη), mathematics, 4 (Archytas); τὰ μ., mathematics

μέγεθος, ους, Ιοπ. εος, τό, magnitude, 444 (Eucl.), ii. 50 (Archim.), ii. 412 (Ptol.)

μέθοδος, ή, following after, investigation, method, 90 (Procl.)

μείζων, ov, greater, more, 318 (Archim.); ἤτοι μ. ἐστὶν ἢ ἐλάσσων, ii. 112 (Archim.); μ. ὀρθῆs, greater than a right angle, 438 (Eucl.); ἤ μ. (sr. εὐθεῖα), major in Euclid's classification of irrationals, 458 (Eucl.)

μένειν, to remain, to remain stationary, 98 (Nicom.), 286 (Eutoc.)

μερίζειν, to divide, τι παρά τι, 50 (Theon Alex.)

μερισμός, ό, division, 16 (Schol. in Plat. Charm.), ii. 414 (Ptol.)

μέρος, ous, Ion. εos, τό, part; of a number, 66 (Eucl.): of a magnitude, 444 (Eucl.), ii. 584 (Papp.); τὰ μέρη, parts, directions, ἐφ' ἐκάτερα τὰ μ., in both directions, 438 (Eucl.)

μεσημβρινός, ή, όν, for μεσημερινός, of or for noon; μ. (sc. κύκλος), ό, meridian, ii. 268 (Cleom.)

μέσος, η, ον, middle; ή μέση (sc. εὐθεῖα), mean (ἀριθμητική, γεωμετρική, ἀρμονική), ii. 568 (Papp.); μέση τῶν ΔΚ, ΚΓ, mean between ΔΚ, ΚΓ, 272 (Eutoc.); ἄκρος καὶ μ. λόγος, extreme and mean ratio, 472 (Eucl.), ii. 416 (Ptol.); ἡ μέση (sc. εὐθεῖα), medial in Euclid's classi-

fication of irrationals, 458 (Eucl.); ἐκ δύο μέσων πρώτη, first bimedial, ἐκ δύο μέσων δευτέρα, second bimedial, etc., ibid.

μεσότης, ητος, ή, mean, ii. 566 (Papp.); μ. ἀριθμητική, γεωμετρική, ἀρμονική (ὑπεναντία), 110-111 (Iambl.) μετρεῦν, to measure, contain

μετρεῖν, to measure, contain an integral number of times, 68 (Eucl.), ii. 54 (Archim.)

μέτρον, τό, measure, relation, ii. 294 (Prob. Bov.); κοινόν μ., common measure, ii. 210 (Archim.)

μέχρι, as far as, prep. with gen.; ή μέχρι τοῦ ἄξονος (sc. γραμμή), ii. 256 (Archim.)

μῆκος, Dor. μᾶκος, εος, τό, length, 436 (Eucl.); distance of weight from fulcrum of a lever, ii. 206 (Archim.)

μηνίσκος, δ, crescent-shaped figure, lune, 238 (Eudemus ap. Simplic.)

μηχανή, ή, contrivance, machine, engine, ii. 26 (Plut.)

μηχανικός, ή, όν, of or for machines, mechanical, ii. 616 (Papp.): ἡ μηχανική (with or without τέχνη), mechanics, ii. 614 (Papp.); as subst., μηχανικός, ό, mechanician, ii. 616 (Papp.), ii. 496 (Damian.) μηχανοποιός, ό, maker of engines, ii. 616 (Papp.)

μικρός, ά, όν, small, little; Μ. ἀστρονομούμενος (sc. τόπος), Little Astronomy, ii. 409 n. b

μικτός, ή, όν, mixed; μ. γραμμή, ii. 360 (Procl.); μ. επιφάνεια, ii. 470 (Heron)

μοῖρα, ας, ή, portion, part: in astron., degree. 50 (Theon Alex.): μ. τοπική, χρονική, ii. 396 (Hypsicl.) μονάς, άδος, ή, unit, monad, 66 (Eucl.)

μοναχός, ή, όν, unique, singular; μ. λόγος, ii. 606 (Papp.)

μόριον, τό, part, 6 (Plat.) μουσικός, ή, όν, Dor. μωσικός,

ά, όν, musical; ἡ μουσικὴ (sc. τέχνη), poetry sung to music, music, 4 (Archytas) μυριάς, άδος, ἡ, the number ten thousand, myriad, ii. 198 (Archim.); μ. ἀπλαῖ, διπλαῖ, κτλ., a myriad raised to the first power.

so on, ii. 355 n. a μύριοι, aι, a, ten thousand, myriad; μ. μυριάδες, myriad myriads, ii. 198 (Archim.)

to the second power, and

Nevew, to be in the direction of, ii. 6 (Aristarch.); of a straight line, to verge, i.e., to be so drawn as to pass through a given point and make a given intercept, 244 (Eudemus ap. Simpl.), 420 (Aristot.), ii. 188

vevous, εωs, ή, inclination, verging, problem in which a straight line has to be drawn through a point so as to make a given intercept, 245 n. a; στερεά ν., solid rerging, 350 (Papp.); Νεύσεις, title of work by Apollonius, ii. 598 (Papp.)

'Οδός, ή, method, ii. 596 (Papp.)

olκείος, a, ov, proper to a thing; δ ol. κύκλος, ii. 270 (Cleom.)

όκτάνωνος. OV. eight-cornered: as subst., δκτάyωνον, τό, regular plane figure with eight sides. octagon, ii. 196 (Archim.) δκτάεδρος, ον**.** witheight faces: as subst... δκτάεδρον, τό, solid with eight faces, ii. 196 (Archim.) όκταπλάσιος, a, ον, eightfold,

όκταπλάσιος, α, ον, eightfold ii. 584 (Papp.)

11. 584 (Papp.) δκτωκαιδεκαπλάσιος, ον, eighteen-fold, ii. 6 (Aristarch.) δκτωκαιτριακοντάεδρον, τό, solid with thirty-eight faces, ii. 196 (Archim.) δλόκληρος, ον, complete, entire; as subst., δλόκληρον, τό, integer, ii. 534 (Dioph.) δλος, η, ον, whole; τὰ δ., 444 (Eucl.)

όμαλός, ή, όν, even, uniform, ii. 618 (Papp.)

όμαλῶs, adv., uniformly, 338 (Papp.)

ομοιος, a, ον, like, similar; δ. τρίγωνον, 288 (Eutoc.);

όμοιοι ἐπίπεδοι καὶ στερεοὶ ἀριθμοί, 70 (Eucl.)

δμορος, (Auch.)

δμοίως, adv., similarly, ii.

176 (Archim.); τὰ δ. τεταγμένα, the corresponding
terms, ii. 166 (Archim.);
δ. κεῖσθαι, to be similarly
situated, ii. 208 (Archim.)
δμολογεῖν, to agree with, admit: pass., to be allowed,
admitted; τὸ ὁμολογούμενον, that which is admitted, premise, ii. 596
(Papp.)

δμόλογος, ον, corresponding; δ. μεγέθεα, ii. 166 (Archim.); δ. πλευραί, ii. 208 (Archim.)

όμοταγής, ές, ranged in the same row or line, co-ordinate with, corresponding to, similar to, ii. 556 (Papp.)

ονομα, ατος, τό, name; ή (sc. εὐθεῖα) ἐκ δύο ὀνομάτων, binomial in Euclid's classification of irrationals, 458
(Eucl.)

όξυγώνιος, ον, ucute-angled; δ. κῶνος and δ. κώνου τομή, ii. 278 (Eutoc.)

όξύς, εῖα, ύ. acute: δ. yωνία, acute angle, often with yωνία omitted, 438 (Eucl.) όπτικός, ή, όν, of or for sight; δπτικά, τά, theory of laws of sight; as prop. name, title of work by Euclid.

156 (Procl.) δργανικός, ή, όν, serving as instruments: δ. ληθις, mechanical solution, 260 (Eutoc.)

οργανικώς, adv., by means of instruments, 292 (Eutoc.)

δργανον, τό, instrument, 294 (Eutoc.); dim. dovavíov. 294 (Eutoc.)

őρθιος, a, ov, upright, erect; ή ορθία (ες. τοῦ είδους πλευρά), the erect side of the rectangle formed by the ordinate of a conic section applied to the parameter as base, latus rectum, an alternative name for parameter, ii. 316 (Apollon.), ii. 322 (Apol-

δρθογώνιος, ov. having all its angles right, right-angled, orthogonal; δ. τετράγωνον, 440 (Eucl.); δ. παραλληλόγραμμον, 268 (Eutoc.) ορθός, ή, όν, right; ο. γωνία,

right angle, 438, 442 (Eucl.); δ. κῶνος, right 286 cone, ii. (Apollon.)

ορίζειν, to separate, delimit, bound, define, 382 (Plat.); ώρισμένη, finite εὐθεῖα straight line, 188 (Eucl.)

δ, boundary, (Eucl.); term in a proportion, 112 (Archytas ap. Porph.), 114 (Nicom.)

ov, therefore, used of the steps in a geometrical

proof, 326 (Eucl.)

dχείσθαι, to be borne, to float in a liquid; Περί τῶν οχουμένων, On floating bodies, title of work by Archimedes, ii. 616 (Papp.)

Παρά, beside; παραβάλλειν π. to apply a figure to a straight line, 188 (Eucl.); τι π. τι παραβάλλειν, to divide by, ii. 482 (Heron)

παραβάλλειν, to throw beside; π. παρά, to apply a figure to a straight line, 188 (Eucl.); hence, since to apply a rectangle xy to a straight line x is to divide xy by x, π = to divide, ii. 482 (Heron)

παραβολή, ή, juxtaposition; division (v. παραβάλλειν), hence quotient, ii. 530 (Dioph.); application of an area to a straight line, 186 (Eucl.); the conic section parabola, so called because the square on the ordinate is equal to a rectangle whose height is equal to the abscissa applied to the parameter as base, ii. 304 (Apol-186 (Procl.), 280 lon.), (Eutoc.)

παράδοξος, ον, contrary to expectation, wonderful; n π. γραμμή, the curve called paradoxical by Menelaus, 348 (Papp.); $\tau \dot{\alpha} \pi$., the paradoxes of Erycinus, ii.

572 (Papp.)

παρακεῖοθαι, to be adjacent. (Papp.), **59**0 283 (Eutoc.)

παραλληλεπίπεδον, τό, figure bounded by three pairs of parallel planes, parallelepiped, ii. 600 (Papp.)

παραλληλόγραμμος, ον, bounded by parallel lines; as subsc. παραλληλόγραμμον, rarallelogram, (Eucl.)

παράλληλος, ov, beside one another, side by side. parallel, 270 (Eutoc.); π. enθείαι. 440 (Eucl.)

παραμήκης, ες, Dor. παραμάκης, ες, oblong; σφαιροειδές π., ii. 164 (Archim.)

παραπλήρωμα, ατος, τό, interstice, ii. 590 (Papp.); complement of a parallelogram, 190 (Eucl.)

παρατείνειν, to stretch out along, produce, 10 (Plat.)

παραύξησις, εως, ή, increase, ii. 412 (Ptol.)

παρύπτιος, ον, hyper-supine; παρύπτιον, τό, a quadrilateral with a re-entrant angle, 482 (Papp.)

πâs, πâσα, πâν, all, the whole, every, any; π. σημείον, any point, 442 (Eucl.)

πεντάγωνος, or, pentagonal; π. ἀριθμός, 96 (Nicom.); as subst., πεντάγωνον, τό, pentagon, 222 (Iambl.)

 $\pi \epsilon \rho \alpha i \nu \epsilon \nu \nu$, to bring to an end; πεπερασμένος, ον, terminated, 280 (Eutoc.); γραμπεπερασμέναι, finite lines, ii. 42 (Archim.)

πέρας, ατος, τό, end, extremity; of a line, 436 (Eucl.); of a plane, 438 (Eucl.)

περατούν, to limit, bound; $\epsilon i^i \theta \epsilon \hat{\imath} a$ περατουμένη. 438 (Eucl.)

 $\pi \epsilon \rho \iota \gamma \rho \dot{a} \phi \epsilon \iota \nu$, to circumscribe, ii. 48 (Archim.)

περιέχειν, to contain, bound: τὸ περιεχόμενον ὑπό, the rectangle contained by, ii. 108 (Archim.); αί περιέχουσαι την γωνίαν γραμμαί, 438 (Eucl.); τὸ περιεχόμενον σχήμα, 440 (Eucl.)

περιλαμβάνειν, to contain, include. ii. 104 chim.)

περίμετρος, ον, very large, well-fitting; ή π. γραμμή) = περίμετρον, τó. perimeter, ii. 318 (Archim.), ii. 502 (Heron), ii. 386 (Theon Alex.)

περισσάκις, Att. περιττάκις. adv., taken an odd number of times; π. ἄρτιος **ἀ**ριθμός, odd-times even number, 68 (Eucl.); περισσός άριθμός, times odd number, 68 (Eucl.)

περισσός, Att. περιττός, η, óv, superfluous; subtle; $d\rho_1\theta_2$ θ_2 θ_3 θ_4 θ_4 θ_5 θ_6 θ_6

(Eucl.)

περιτιθέναι, to place or put around, 94 (Aristot.)

περιφέρεια, ή, circumference or periphery of a circle. arc of a circle, 440 (Eucl.), ii. 412 (Ptol.)

περιφορά, ή, revolution, turnof a spiral, ii. 182 (Archim.)

πη \ικότης, ητος, ή, magnitude. size, ii. (Ptol.)

πίπτειν, to fall: of points, ii. 44 (Archim.); of a straight line, 286 (Eutoc.)

πλάγιος, a, ov, oblique; π. διάμετρος, transverse diameter of a conic section, ii. 286 (Apollon.); π. πλευρά, transverse side of the rectangle formed by the ordinate of a conic section applied to the parameter as base, ii. 316 (Apollon.) and ii. 323 (Apollon.)

πλάσσειν, to form; of numbers, ii. 528 (Dioph.)

πλάτος, ους, Ion. εος, τό, breadth, 438 (Eucl.)

πλατύνειν, to widen, broaden, 88 (Nicom.)

πλευρά, âs, ή, side; of a triangle, 440 (Eucl.); of a parallelogram, ii. 216 (Archim.); of a square, hence, square root, ii. 530 (Dioph.); of a number, 70 (Eucl.); πλαγία π., latus rectum of a conic section, ii. 322 (Apollon.): π. καὶ διαμέτρος, 132 (Theon Smyr.)

πληθος, ους, Ion. εος, τό, number, multitude, 66

(Eucl.)

πνευματικός, ή, όν, of wind or air; Πνευματικά, τά, title of work by Heron, ii. 616

(Papp.)

ποιέτν, to do, construct, ii. 566 (Papp.); to make, π. τομήν, ii. 290 (Apollon.); to be equal to, to equal, ii. 526 (Dioph.)

πολλαπλασιάζειν, to multiply, 70 (Eucl.)

πολλαπλάσιος, a, ov, many times as large, multiple; of a number, 66 (Eucl.); of a magnitude, ±44 (Eucl.); as subst., πολλαπλάσιον, τό, multiple; τὰ ἰσάκις π., equimultiples, 446 (Eucl.)

πολλαπλασίων, ον = πολλαπλά- σιος, ii. 212 (Archim.)

πόλος, ό, pole; of a sphere, ii. 580 (Papp.); of a conchoid, 300 (Papp.)

πολύγωνος, ον, having many angles, polygonal; comp., πολυγωνότερος, ον, ii. 592 (Papp.); as subst., πολύγωνον, τό, polygon, ii. 48 (Archim.)

πολύεδρος, ον, having many bases; as subst., πολύεδρον, τό, polyhedron, ii.

572 (Papp.)

πολυπλασιασμός, ό, multiplication, 16 (Schol. in Plat. Charm.), ii. 414 (Apollon.)

πολύπλευρος, ον, many sided, multilateral, 440 (Eucl.)

πορίζειν, to bring about, find either by proof or by construction, ii. 598 (Papp.), 252 (Procl.)

πόρισμα, ατος, τό, corollary to a proposition, 480 (Procl.), ii. 294 (Apollon.); kind of proposition intermediate between a theorem and a problem, porism, 480 (Procl.)

ποριστικός, ή, όν, able to supply or find; ποριστικόν τοῦ προταθέντος, ii. 598 (Papp.)

πραγματεία, ή, theory, investigation, 148 (Procl.), ii. 406 (Theon Alex.)

πρίσμα, ατος, τό, prism, ii. 470 (Heron)

πρόβλημα, ατός, τό, problem, 14 (Plat.), 258 (Eutoc.), ii. 566 (Papp.)

προβληματικός, ή, όν, of or for a problem; applied to species of analysis, ii. 598 (Papp.)

πρόδηλος, ον, clear, manifest, ii. 496 (Heron)

προηγεῖσθὰι, to take the lead; προηγούμενα, τά, forward points, i.e. those lying on the same side of a radius vector of a spiral as the direction of its motion, ii. 184 (Archim.)

προκατασκευάζειν, to construct beforehand, 276 (Eutoc.)

προμήκης, ες, prolonged, oblong, 398 (Plat.)

πρός, Dor. ποτί, prep., towards; ώς ἡ ΔΚ πρὸς ΚΕ, the ratio ΔΚ: ΚΕ, 272 (Eutoc.)

προσπίπτειν, to fall, 300 (Eutoc.): αὶ προσπίπτουσαι εὐθεῖαι, 438 (Eucl.), ii. 594 (Papp.)

προστιθέναι, **t**o add, 444 (Fuel.)

πρότασις, εως, ή, proposition, enunciation, ii. 566 (Papp.)

προτείνειν, to propose, to enunciate a proposition, ii. 566 (Papp.); τὸ προτεθέν, that which was proposed, proposition, ii. 220 (Archim.)

πρώτιστος, η, ον, also os, ov, the very first, 90 (Nicom.)

πρῶτος, η, ον, first; π. ἀριθμός, prime number, 68
(Eucl.); but π. ἀριθμοί,
numbers of the first order
in Archimedes, ii. 198
(Archim.); in astron., π.
ἐξηκοστόν, first sixtieth,
minute, 50 (Theon Alex.);
in geom., π. εὐθεῖα, first
distance of a spiral, ii. 182
(Archim.)

 $\pi\tau\hat{\omega}\sigma$ is, $\epsilon\omega$ s, $\dot{\eta}$, case of a theorem or problem, ii.

600 (Papp.)

πυθμήν, ένος, ό, base, basic number of a series, i.e., lowest number possessing a given property, 398 (Plat.); number of tens, hundreds, etc., contained in a number, ii. 354 (Papp.)

πυραμίς, ίδος, ή, pyramid, 228 (Archim.)

'Péπειν, to incline; of the weights on a balance, ii. 208

όητός, ή, όν, rational, 398 (Plat.), 452 (Eucl.)

ρίζα, Ion. ρίζη, ή, root; ἀρχικωτάτη ρίζα, 90 (Nicom.)

οομβοειδής, és. rhombusshaped, rhomboidal;

σχημα, 440 (Eucl.)

ρόμβος, ό, plane figure with four equal sides but with only the opposite angles rhombus. equal, (Eucl.); ρ. στερεός, figure formed by two cones having the same base and their axes in a straight line, solid rhombus, ii. 44 (Archim.)

Σημαίνειν, to signify, 188 (Procl.)

σημείον, Dor. σαμείον, τό, point, 436 (Eucl.); sign, ii. 522 (Dioph.)

σκαληνός, ή, όν, also ός, όν, oblique, scalene; κῶνος σ., ii. 286 (Apollon.)

σκέλος, ους, Ion. εος, τό, leg; σ. της γωνίας, 264 (Eutoc.) σπείρα, ή, surface traced by a circle revolving about a point not its centre, spire, tore, torus, ii. 468 (Heron)

σπειρικός, ή, όν, pertaining to a spire, spiric; σ. τομαί, spiric sections, ii. 364 (Procl.); σ. γραμμαί, spiric curves, ii. 364 (Procl.)

στερεός, ά, όν, solid : σ. γωνία, solid angle, 222 (Plat.); σ. ἀριθμός, cubic number; τοποί, solid loci, ii. 600 (Apollon.); σ. πρόβλημα, solid problem, 348 (Papp.); σ. νεῦσις, solid verging, 350 (Papp.); as subst., στερεόν, τό, solid. 258 (Eutoc.)

στιγμή, ή, point, 80 (Nicom.) στοιχείον, τό, element, ii. 596 (Papp.); elementary book, 150 (Procl.); Στοιχεῖα, τά, the *Elements*, especially Euclid's

στοιχείωσις, εως, ή, elementary exposition, elements: Euclid's Elements of geometry, 156 (Procl.); al κατά μουσικήν σ., the elementsof music, (Procl.); σ. τῶν κωνικῶν. elements of conics, ii. 276 (Eutoc.)

στοιχειωτής, οῦ, ὁ, teacher of elements, writer of elements, esp. Euclid, ii. 596 (Papp.)

στρογγύλος, η, ον, round, 39? (Plat.)

συγκεισθαι, to lie together; as pass. of $\sigma v r \iota \theta \dot{\epsilon} v a \iota$, to be 284 composed of, ii. (Apollon.)

σύγκρισις, $\epsilon \omega \varsigma$, $\dot{\eta}$, comparison; Τῶν πέντε σχημάτων σ., Comparison of the Five Figures, title of work by Aristaeus, ii. 348 (Hypsicl,)

συζυγής, ές, yoked together, conjugate: σ . $\delta_{i}\dot{\alpha}\mu\epsilon\tau\rho\sigma_{i}$. σ . άξονες, ii. 288 (Apollon.)

σύμμετρος, ov. commensurate with, commensurable with: 380 (Plat.), 452 (Eucl.), ii. 208 (Archim.)

συμπαρατείνειν, to stretch out alongside of, 188 (Procl.)

σύμπας, σύμπασα, σύμπαν, all together, the sum of, ii. 514 (Dioph.)

συμπέρασμα, ατος, τό, conclusion, ii. 228 (Archim.) to meet, συμπίπτειν. 190 (Eucl.); την μέν έν αὐτη o., of curves which meet themselves. 360 (Procl.)

συμπληροῦν, to fill, complete; σ. παραλληλόγραμμον, 268 (Eutoc.)

σύμπτωμα, ατος, τό, property of a curve, 336 (Papp.)

σύμπτωσις, εως, ή, fulling tomeeting, ii. 64 gether, (Archim.), ii, 270 (Cleom.), 286 (Eutoc.)

συναγωγή, ή, collection: title of work by Pappus, ii. 568 (Papp.)

συναμφότερος, ov, the sum of, 328 (Archim.)

συνάπτειν, to collect, gather; συνημμένος λόγος, compound ratio, ii. 602Papp.)

συνεγγίζειν, to approximate, ii. 414 (Ptol.), ii.

(Heron)

σύνεγγυς, adv., near. approximately, ii. 488 (Heron)

συνεχής, ές, continuous, 442 (Eucl.); σ. ἀναλογία, continued proportion, ii. 566 (Papp.); σ. ἀνάλογον, 302 (Papp.); σπείρα σ., ii. 364 (Procl.)

ουνθέντι, υ. ουντιθέναι

σύιθεσις, εως, ή, putting together, composition;

λόγου, transformation of a known as 448 (Eucl.): ponendo, method of reasoning from assumptions to conclusions, in contrast with analysis, synthesis, ii. 596 (Papp.)

σύνθετος, ον, composite; dριθμός, 68 (Eucl.); γραμμή, ii. 360 (Procl.)

συνιστάναι, to set up, construct, 190 (Eucl.), 312 (Them.)

σύνταξις, εως, ή, putting together in order, systematic treatise, composite volume, collection: title of work by Ptolemy, ii. 408 (Suidas)

συντιθέναι, to place or put together, add together, used of the synthesis of a problem, ii. 160 (Archim.); συνθέντι, lit. to one having compounded. the formation of a ratio known as componendo, ii. (Archim.)

σύστασις, $\epsilon \omega \varsigma$, $\dot{\eta}$, grouping (of theorems), 150 (Procl.) σφαΐρα, ή, sphere, 466 (Eucl.), ii. 40 (Archim.), ii. 572

(Papp.)

σφαιρικός, ή, όν, spherical, ii. 581 (Papp.); Σφαιοικά. title of works by Menelaus and Theodosius

artificial σφαιροποιία. sphere, making of the heavenly spheres, ii. 618 (Papp.)

σχημα, ατος, τό, shape, figure, 438 (Eucl.), ii. 42 (Archim.)

σχηματοποιείν, to bring into a certain form or shape; σχηματοποιούσα γραμμή, curve forming a figure, ii. 360 (Procl.)

Τάλαντον, τό, weight known as the talent, ii. 490 (Heron)

τάξις, εως, ή, order, arrangement. scheme. 112 (Iambl.)

 τ apággeiv, to disturb: $\tau \epsilon \tau a$ ραγμένη ἀναλογία, disturbed proportion, 450 (Eucl.)

τάσσειν, to draw up in order. ii. 598 (Papp.); όμοίως τεταγμένα, ii. 166chim.); perf. part. pass. used as adv., τεταγμένως, ordinate-wise, ii. (Apollon.); αί καταγόμεναι τεταγμένως (sc. εὐθεῖαι), the straight lines drawn ordinate-wise, i.e., the ordinates, of a conic section, ii. 308 (Apollon.); τεταγμένως ή ΓΑ, ii. (Archim.)

τέλειος, α, ον, perfect, complete, ii. 604 (Papp.); τ. άριθμός, 76 (Speusippus ap. Theol. Arith.), 70 (Eucl.), 398 (Plat.)

τέμνειν, to cut; of straight lines by a straight line, ii. (Apollon.); of a 288curve by a straight line, 278 (Eutoc.); of a solid bv \mathbf{a} plane. ii. 288 (Apollon.)

τεσσαρεσκαιδεκάεδρον, τó. solid with fourteen faces, ii. 196 (Archim.)

τεταγμένως, υ, τάσσειν

τεταραγμένος, ον, ν. ταράσ-

τεταρτημόριον, τό, fourth part, quadrant of a circle, ii. 582 (Papp.)

τετραγωνίζειν, to make square, ii. 494 (Heron); to square, 10 (Plat.); ή τετραγωνίζουσα (sc. γραμμή), quadratrix, 334 (Simpl.), 336 (Papp.)

τετραγωνικός, ή, όν, square; numbers. ii. (Dioph.); τ. πλευρά, square root, 60 (Theon Alex.)

τετραγωνισμός, δ. squaring. 310 (Aristot.) : τοῦ κύκλου τ., 308 (Plut.); τοῦ μηνίσκου τ., 150 (Procl.)

τετράγωνος, ον, square, 308 (Aristophanes), ii. (Heron); ἀριθμὸς τ., square number. ii. 514 (Dioph.); τ. κρίκοι, square rings, ii. 470 (Heron); as subst... τετράγωνον, τό, square, 440 (Eucl.); square number, 518 (Dioph.)

τετράκις, adv., four times, 326 (Archim.)

τετραπλάσιος, a, ov, four-fold, four times as much, 332 (Archim.)

τετραπλασίων, ον, later form of τετραπλάσιος τετράπλευρος, ον, four-sided.

quadrilateral; σχήματα τ., 440 (Eucl.)

τιθέναι, to set, put, place, ii. 224 (Archim.); θετέον, must be posited, 392 (Plat.); τὸ ΛΒ τεθέν ἐπὶ τῷ Ζ, Λ+Β placed at Ζ, ii. 214 (Archim.)

τμῆμα, Dor. τμᾶμα, ατος, τό, segment; of a circle. ii. 584 (Papp.); of a sphere, ii.
 40 (Archim.); in astron., τ½, th part of diameter of a circle, ii. 412 (Ptol.)

τομεύς, έως, ό, sector of a circle, ii. 582 (Papp.); τ. στερεός, sector of a sphere (intercepted by cone with vertex at centre), ii. 41 (Archim.)

τομή, ή, end left after cutting, section: section of a straight line, 268 (Eutoc.): section of a cone, conic section, ii. 278 (Apollon.); αντικείμεναι, opposite branches of a hyperbola, ii. 322 (Apollon.); σπειρικαί τ., ii. 364 (Procl.); κοινή τ., common section, 286 (Eutoc.); Διωρισμένη 7., Determinate Section. title of work by Apollonius, ii. 598 (Papp.); $\tau \dot{a} \pi \epsilon \rho i \tau \dot{n} \nu \tau .$, theorems about the section (? of a line cut in extreme and mean ratio), 152 (Procl.)

τοπικός, ή, όν, of or pertaining to place or space: pertaining to a locus, 490 (Papp.); μοΐρα τ., degree in space, ii. 396 (Hypsiel.)

τόπος, δ, place, region, space, ii. 590 (Papp.); locus, 348 (Papp.); Τ. ἐπίπεδοι, Plane Loci, title of work by Apollonius, ii. 598 (Papp.); Τ. στερεοί, Solid Loci, title of work by Aristaeus, iii. 600 (Papp.)

τραπέζιον, τό, trapezium, 440 (Eucl.), ii. 488 (Heron)

τριάς, άδος, ἡ, the number three, triad, 90 (Nicom.); Μεναιχμεῖαι τ., the three conic sections of Menaechnus, 296 (Erat. ap. Eutoc.)

τρίγωνος, ον, three-cornered, triangular; ἀρθμοὶ τρίγωνοι, triangular numbers; as subst., τρίγωνον, τό, triangle, 440 (Eucl.), 316 (Archim.); τὸ διὰ τοῦ ἄξονος τ., axial triangle, ii. 288 (Apollon.)

τριπλάσιος, a, or, thrice as many, thrice as great as, 326 (Archim.), ii. 580 (Papp.)

τριπλασίων, ον = τριπλάσιος, 320 (Archim.); τ. λόγος, 448 (Eucl.)

τρίπλευρος, ον, three-sided, trilateral: σχήματα τ., 440 (Eucl.)

τρίχα, thrice, in three parts, τ. τεμεῖν τὴν γωνίαν, to trisect the angle, 300 (Papp.)

τυγχάνειν, to happen to be: aor. part., τυχών, τυχοῦσα, τυχόν, any, taken at ran-

dom, $\epsilon \vec{v} \theta \epsilon \hat{\imath} a \tau$., ii. 486 (Heron); as adv., τυχόν, perchance, 264 (Eutoc.)

Υδρείον, τό, bucket, pitcher: pl., Υδρεία, title of work on water clocks by Heron, ii. 616 (Papp.)

ὖπαρξις, εως, ή, existence, ii. 518 (Dioph.); positive term, ii. 524 (Dioph.)

ύπεναντίος, a, ov, subcontrary; ύ. μέσα, 112 (Archytas ap. Porph.); υ. τομή, ii. 304 (Apollon.)

ύπεναντίως, subcontrary-wise, ii. 301-30? (Apollon.)

ύπερβάλλειν, to exceed, 188 (Procl.)

ύπερβολή, ή, exceeding, 186 (Procl.); the conic section hyperbola, so called because the square on the ordinate is equal to a rectangle with height equal to the abscissa applied to the parameter as base, but exceeding (ὑπερβάλλον), i.e., overlapping, that base, ii. 310 (Apollon.), (Procl.)

ύπερέχειν. to exceed, 112 (Archytas ap. Porph.), 444 (Eucl.), ii. 608 (Papp.); τῶ αὐτῷ μέρει τῶν ἄκρων αὐτῶν ὑπερέχον τε ύπερεχόμενον, 402 (Plat.)

ύπεροχή, Dor. ὑπεροχά, ἡ, excess, 112 (Archytas ap. Porph.), 318 (Archim.), ii. 530 (Dioph.), ii. 608 (Papp.)

ύπερπίπτειν, to fall beyond, exceed, ii. 436 (Ptol.)

ύπό, by; ή ύπὸ ΗΒΕ γωνία, the angle HBE. (Eucl.); $\tau \dot{o} \ \dot{v} \pi \dot{o} \ \Delta E \Gamma \ (sc.$ εὐθύνραμμον), the rectangle contained by ΔE , $E\Gamma$, 265(Eutoc.)

ὑπόθεσις, εως, ή, hypothesis, 420 (Aristot.). ii.

(Archim.)

ύποπολλαπλάσιος. ov. multiple of another: subst., ὑποπολλαπλάσιου, τό, submultiple. 78 (Theol. Arith.)

ύπόστασις, εως, ή, condition,

ii. 534 (Dioph.)

υποτείνειν, to stretch under, subtend, be subtended by; ή ύπὸ δύο πλευράς τοῦ πολυνώνου υποτείνουσα ευθεία. the straight line subtending, or subtended by, two sides of the polygon, ii. 96 (Archim.); πλευρά τείνουσα μοίρας ξ, side subtending sixty parts, ii. 418 (Ptol.); $\dot{\eta}$ $\tau \dot{\eta} \nu$ όρθην γωνίαν ύποτεινούση side subπλευρά, the tending the right angle, 178 (Eucl.); hence ή ύποτείνουσα (sc. πλευρά or γραμμή). hypotenuse a right-angled triangle. 176 (Plut.)

ύποτιθέναι, pass. ύποκεῖσθαι, to suppose, assume, make a hypothesis, ii. 2 (Archim.), ii. 301 (Apollon.)

υπτιος, a, ov, laid on one's

back, supine; ὅπτιον, τό, a quadrilateral with no parallel sides, 482 (Papp.) ὑφιστάναι, to place or set under, ii. 362 (Procl.) ὑψος, ους, Ion. ϵος, τό, height; of a triangle, ii. 222 (Archim.); of a cylinder, ii. 42 (Archim.): of a cone, ii. 118 (Archim.)

Φανερός, ά, όν, clear, manifest, ii. 64 (Archim.), ii. 570 (Papp.)
φέρειν, to bear, carry; pass., to be borne, carried, more, revolve: σημεῖον φερόμενον, ii. 582 (Papp.); τὸ φερόμενον, moving object, 366 (Aristot.)
ξορά, ή, motion, 12 (Plat.)

Χείρ, χειρός, ή, band or number of men, 30 n. a χειρουργικός, ή, όν, manual, ii. 614 (Papp.) χρονικόs, ή, όν, of or pertaining to time; μοῖρα χ., degree in time, ii. 396 (Hypsicl.)

χωρίον, τό, space, area, 394 (Plat.), ii. 532 (Dioph.)

Ψαύειν, to touch, 264 (Eutoc.) ψευδάριον, τό, fallacy: Ψευδάρια, τά, title of work by Euclid, 160 (Procl.)

'Ωρολόγιον, τό, instrument for telling the time, clock, ii. 268 (Čleom.); τὸ δι' ὕδατος ώ., water-clock, ii. 616 (Papp.)

ωs, as; ωs η ZΕ προς ΕΓ, η ZΗ προς ΗΓ, i.e., ZΕ : ΕΓ = ZΗ : ΗΓ, 322 (Archim.)

ωστε, such that, ii. 52 (Archim.); and so, therefore, used for the stages in a proof, ii. 54 (Archim.)
